ANNEX I

SUMMARY OF PRODUCT CHARACTERISTICS
1. NAME OF THE MEDICINAL PRODUCT
DaTSCAN 74 MBq/ml solution for injection

2. QUALITATIVE AND QUANTITATIVE COMPOSITION
Each ml of solution contains ioflupane (\(^{123}\)I) 74 MBq at reference time (0.07 to 0.13 µg/ml of ioflupane).

Each 2.5 ml single dose vial contains 185 MBq ioflupane (\(^{123}\)I) (specific activity range 2.5 to 4.5 x 10\(^{14}\) Bq/mmol) at reference time.

Each 5 ml single dose vial contains 370 MBq ioflupane (\(^{123}\)I) (specific activity range 2.5 to 4.5 x 10\(^{14}\) Bq/mmol) at reference time.

Excipient(s) with known effect
This medicinal product contains 39.5 g/l ethanol.
For the full list of excipients see section 6.1.

3. PHARMACEUTICAL FORM
Solution for injection.
Clear colourless solution.

4. CLINICAL PARTICULARS

4.1 Therapeutic indications
This medicinal product is for diagnostic use only.

DaTSCAN is indicated for detecting loss of functional dopaminergic neuron terminals in the striatum:
- In adult patients with clinically uncertain Parkinsonian Syndromes, for example those with early symptoms, in order to help differentiate Essential Tremor from Parkinsonian Syndromes related to idiopathic Parkinson’s Disease, Multiple System Atrophy and Progressive Supranuclear Palsy. DaTSCAN is unable to discriminate between Parkinson's Disease, Multiple System Atrophy and Progressive Supranuclear Palsy.
- In adult patients, to help differentiate probable dementia with Lewy bodies from Alzheimer’s disease.
  DaTSCAN is unable to discriminate between dementia with Lewy bodies and Parkinson’s disease dementia.

4.2 Posology and method of administration
Prior to administration appropriate resuscitation equipment should be available.

DaTSCAN should only be used in adult patients referred by physicians experienced in the management of movement disorders and/or dementia. DaTSCAN should only be used by qualified personnel with the appropriate government authorisation for the use and manipulation of radionuclides within a designated clinical setting.
Posology

Clinical efficacy has been demonstrated across the range 111 to 185 MBq. Do not exceed 185 MBq and do not use when the activity is below 110 MBq.

Patients must undergo appropriate thyroid blocking treatment prior to injection to minimise thyroid uptake of radioactive iodine, for example by oral administration of approximately 120 mg potassium iodide 1 to 4 hours prior to injection of DaTSCAN.

Special populations

Renal and hepatic impairment
Formal studies have not been carried out in patients with significant renal or hepatic impairment. No data are available (see section 4.4).

Paediatric population
The safety and efficacy of DaTSCAN in children aged 0 to 18 years has not been established. No data are available.

Method of Administration
For intravenous use.

DaTSCAN should be used without dilution. To minimise the potential for pain at the injection site during administration, a slow intravenous injection (not less than 15 to 20 seconds) via an arm vein is recommended.

SPECT imaging should take place between three and six hours post-injection. Images should be acquired using a gamma camera fitted with a high-resolution collimator and calibrated using the 159 keV photopeak and a ± 10% energy window. Angular sampling should preferably be not less than 120 views over 360 degrees. For high resolution collimators the radius of rotation should be consistent and set as small as possible (typically 11-15cm). Experimental studies with a striatal phantom, suggest that optimal images are obtained with matrix size and zoom factors selected to give a pixel size of 3.5-4.5 mm for those systems currently in use. A minimum of 500k counts should be collected for optimal images. Normal images are characterised by two symmetrical crescent-shaped areas of equal intensity. Abnormal images are either asymmetric or symmetric with unequal intensity and/or loss of crescent.

4.3 Contraindications

- Hypersensitivity to the active substance or to any of the excipients listed in section 6.1.
- Pregnancy (see section 4.6).

4.4 Special warnings and precautions for use

If hypersensitivity reactions occur, the administration of the medicinal product must be discontinued immediately and, if necessary, intravenous treatment initiated. Resuscitative medicinal products and equipment (e.g. endotracheal tube and ventilator) have to be readily available.

This radiopharmaceutical may be received, used and administered only by authorised persons in designated clinical settings. Its receipt, storage, use, transfer and disposal are subject to the regulations and the appropriate licences of the local competent official organisations.

For each patient, exposure to ionising radiation must be justifiable on the basis of likely benefit. The activity administered must be such that the resulting dose is as low as reasonably achievable bearing in mind the need to obtain the intended diagnostic result.
Formal studies have not been carried out in patients with significant renal or hepatic impairment. In the absence of data, DaTSCAN is not recommended in cases of moderate to severe renal or hepatic impairment.

This medicinal product contains 39.5 g/l (5% volume) ethanol (alcohol), up to 197 mg per dose, equivalent to 5 ml beer or 2 ml wine. Harmful for those suffering from alcoholism. To be taken into account in high-risk groups such as patients with liver disease or epilepsy.

4.5 Interaction with other medicinal products and other forms of interaction

No interaction studies have been performed in humans.

Ioflupane binds to the dopamine transporter. Medicines that bind to the dopamine transporter with high affinity may therefore interfere with DaTSCAN diagnosis. These include amfetamine, benzetropine, bupropion, cocaine, mazindol, methylphenidate, phentermine and sertraline.

Medicines shown during clinical trials not to interfere with DaTSCAN imaging include amantadine, trihexyphenidyl, budipine, levodopa, metoprolol, pramidone, propranolol and selegiline. Dopamine agonists and antagonists acting on the postsynaptic dopamine receptors are not expected to interfere with DaTSCAN imaging and can therefore be continued if desired. Medicinal products shown in animal studies not to interfere with DaTSCAN imaging include pergolide.

4.6 Fertility, pregnancy and lactation

Women of childbearing potential
Where it is necessary to administer radioactive medicinal products to women of childbearing potential, information should always be sought about pregnancy. Any woman who has missed a period should be assumed pregnant until proven otherwise. Where uncertainty exists, it is important that radiation exposure should be the minimum consistent with achieving satisfactory imaging. Alternative techniques which do not involve ionising radiation should be considered.

Pregnancy
Animal reproductive toxicity studies have not been performed with this product. Radionuclide procedures carried out on pregnant women also involve radiation doses to the foetus. Administration of 185 MBq of ioflupane (123I) results in an absorbed dose to the uterus of 3.0 mGy. DaTSCAN is contraindicated in pregnancy (see section 4.3).

Breastfeeding
It is not known whether ioflupane (123I) is excreted in human milk. Before administering a radioactive medicinal product to a breast-feeding mother, consideration should be given as to whether the investigation could be reasonably delayed until the mother has ceased breast-feeding and as to whether the most appropriate choice of radiopharmaceutical has been made, bearing in mind the secretion of radioactivity in breast milk. If administration is considered necessary, breast-feeding should be interrupted for 3 days and substituted by formula feeding. During this time, breast milk should be expressed at regular intervals and the expressed feeds should be discarded.

Fertility
No fertility studies have been performed. No data are available.

4.7 Effects on ability to drive and use machines

DaTSCAN has no known influence on the ability to drive and use machines.
4.8 Undesirable effects

Summary of the safety profile
No serious adverse reactions related to DaTSCAN administration have been reported.

Tabulated summary of adverse reactions
The frequencies of adverse reactions are defined as follows:
Very common (≥1/10), common (≥1/100 to <1/10), uncommon (≥1/1,000 to <1/100), rare (≥1/10,000 to <1/1,000), very rare (<1/10,000) and not known (cannot be estimated from the available data). Within each frequency grouping, undesirable effects are presented in order of decreasing seriousness.

Immune system disorders
Not known: Hypersensitivity

Metabolism and nutrition disorders
Uncommon: Appetite increased

Nervous system disorders
Common: Headache
Uncommon: Dizziness, formication (paraesthesia), dysgeusia

Ear and labyrinth disorders
Uncommon: Vertigo

Gastrointestinal disorders
Uncommon: Nausea, dry mouth

General disorders and administration site conditions
Uncommon: Injection site pain (intense pain following administration into small veins)

Exposure to ionising radiation is linked with cancer induction and a potential for development of hereditary defects. As the effective dose is 4.35 mSv when the maximal recommended activity of 185 MBq is administered these adverse events are expected to occur with a low probability.

Reporting of suspected adverse reactions
Reporting suspected adverse reactions after authorisation of the medicinal product is important. It allows continued monitoring of the benefit/risk balance of the medicinal product. Healthcare professionals are asked to report any suspected adverse reactions via the national reporting system listed in Appendix V.

4.9 Overdose

In cases of overdose of radioactivity, frequent micturition and defaecation should be encouraged in order to minimise radiation dose to the patient. Care should be taken to avoid contamination from the radioactivity eliminated by the patient using such methods.

5. PHARMACOLOGICAL PROPERTIES

5.1 Pharmacodynamic properties

Pharmacotherapeutic group: Diagnostic radiopharmaceutical central nervous system, ATC code: V09AB03.
Due to the low quantities of ioflupane injected, pharmacological effects are not expected following intravenous administration of DaTSCAN at the recommended dosage.

**Mechanism of action**
Ioflupane is a cocaine analogue. Studies in animals have shown that ioflupane binds with high affinity to the presynaptic dopamine transporter and so radiolabelled ioflupane (\(^{123}\text{I}\)) can be used as a surrogate marker to examine the integrity of the dopaminergic nigrostriatal neurons. Ioflupane also binds to the serotonin transporter on 5-HT neurons but with lower (approximately 10-fold) binding affinity.

There is no experience in types of tremor other than essential tremor.

**Clinical efficacy**
Clinical studies in patients with Lewy bodies

In a pivotal clinical trial including evaluation of 288 subjects with dementia with Lewy bodies (DLB) (144 subjects), Alzheimer’s disease (124 subjects), vascular dementia (9 subjects) or other (11 subjects), the results of an independent, blinded visual assessment of the DaTSCAN images were compared to the clinical diagnosis as determined by physicians experienced in the management and diagnosis of dementias. Clinical categorisation into the respective dementia group was based on a standardised and comprehensive clinical and neuropsychiatric evaluation. The values for the sensitivity of DaTSCAN in determining probable DLB from non-DLB ranged from 75.0% to 80.2% and specificity from 88.6% to 91.4%. The positive predictive value ranged from 78.9% to 84.4% and the negative predictive value from 86.1% to 88.7%. Analyses in which both possible and probable DLB patients were compared with non-DLB dementia patients demonstrated values for the sensitivity of DaTSCAN ranging from 75.0% to 80.2% and specificity from 81.3% to 83.9% when the possible DLB patients were included as non-DLB patients. The sensitivity ranged from 60.6% to 63.4% and specificity from 88.6% to 91.4% when the possible DLB patients were included as DLB patients.

5.2 Pharmacokinetic properties

**Distribution**
Ioflupane (\(^{123}\text{I}\)) is cleared rapidly from the blood after intravenous injection; only 5% of the administered activity remains in whole blood at 5 minutes post-injection.

**Organ uptake**
Uptake in the brain is rapid, reaching about 7% of injected activity at 10 minutes post-injection and decreasing to 3% after 5 hours. About 30% of the whole brain activity is attributed to striatal uptake.

**Elimination**
At 48 hours post-injection, approximately 60% of the injected radioactivity is excreted in the urine, with faecal excretion calculated at approximately 14%.

5.3 Preclinical safety data

Non-clinical data for ioflupane reveal no special hazard for humans based on conventional studies of safety pharmacology, single and repeated dose toxicity and genotoxicity.

Studies on reproductive toxicity and to assess the carcinogenic potential of ioflupane have not been performed.

6. **PHARMACEUTICAL PARTICULARS**

6.1 List of excipients

Acetic acid
Sodium acetate
Ethanol
Water for injections

6.2 Incompatibilities

Not applicable

6.3 Shelf-life

2.5 ml vial: 7 hours from the activity reference time stated on the label.
5 ml vial: 20 hours from the activity reference time stated on the label.

6.4 Special precautions for storage

Do not store above 25°C. Do not freeze.

6.5 Nature and contents of container

2.5 or 5 ml solution in a single colourless 10 ml glass vial sealed with a rubber closure and metal overseal.
Pack size of 1.

Not all pack sizes may be marketed.

6.6 Special precautions for disposal and other handling

General warning
Normal safety precautions for handling radioactive materials should be observed.

Disposal
After use, all materials associated with the preparation and administration of radiopharmaceuticals, including any unused product and its container, should be decontaminated or treated as radioactive waste and disposed of in accordance with the conditions specified by the local competent authority. Contaminated material must be disposed of as radioactive waste via an authorised route.

Date of latest renewal: 28 July 2010
10. DATE OF REVISION OF THE TEXT

11. DOSIMETRY

Iodine-123 has a physical half-life of 13.2 hours. It decays emitting gamma radiation with a predominant energy of 159 keV and X-rays of 27 keV.

The estimated absorbed radiation doses to an average adult patient (70 kg) from intravenous injection of ioflupane (123I) are listed below. The values are calculated assuming urinary bladder emptying at 4.8-hour intervals and appropriate thyroid blocking (Iodine-123 is a known Auger electron emitter). Frequent bladder emptying should be encouraged after dosing to minimise radiation exposure.

**Effective Dose** 23.5 µSv/MBq

The effective dose (E) resulting from administration of 185 MBq of DaTSCAN injection is 4.35 mSv (per 70 kg individual). The above data are valid in normal pharmacokinetic behaviour. When renal or hepatic function is impaired, the effective dose and the radiation dose delivered to organs might be increased.

12. INSTRUCTIONS FOR PREPARATION OF RADIOPHARMACEUTICALS

Any unused medicinal product or waste material should be disposed of in accordance with local requirements. See also section 6.6.

Detailed information on this medicinal product is available on the website of the European Medicines Agency [http://www.ema.europa.eu](http://www.ema.europa.eu)

B. PACKAGE LEAFLET
Package leaflet: Information for the user

DaTSCAN 74 MBq/ml solution for injection
Ioflupane (¹²³I)

Read all of this leaflet carefully before you start using this medicine because it contains important information for you.
– Keep this leaflet. You may need to read it again.
– If you have any further questions, ask your nuclear medicine doctor who will supervise the procedure.
– If you get any side effects, talk to your nuclear medicine doctor. This includes any possible side effects not listed in this leaflet. See section 4.

What is in this leaflet

1. What DaTSCAN is and what it is used for
2. What you need to know before DaTSCAN is used
3. How DaTSCAN is used
4. Possible side effects
5. How DaTSCAN is stored
6. Contents of the pack and other information

1. What DaTSCAN is and what it is used for

DaTSCAN contains the active substance ioflupane (¹²³I) which is used to help identify (diagnose) conditions in the brain. It belongs to a group of medicines called “radiopharmaceuticals”, which contain a small amount of radioactivity.

- When a radiopharmaceutical is injected, it collects in a specific organ or area of the body for a short time.
- Because it contains a small amount of radioactivity it can be detected from outside the body using special cameras.
- A picture, known as a scan, can be taken. This scan will show exactly where the radioactivity is inside the organ and the body. This can give the doctor valuable information about how that organ is working.

When DaTSCAN is injected into an adult, it is carried around the body in the blood. It collects in a small area of your brain. Changes in this area of the brain occur in:

- Parkinsonism (including Parkinson’s disease) and
dementia with Lewy bodies.

A scan will give your doctor information about any changes in this area of your brain. Your doctor may feel that the scan would help in finding out more about your condition and deciding on possible treatment.

When DaTSCAN is used, you are exposed to small amounts of radioactivity. This exposure is less than in some types of X-ray investigation. Your doctor and the nuclear medicine doctor have considered that the clinical benefit of this procedure with the radiopharmaceutical outweighs the risk of being exposed to these small amounts of radiation.

This medicine is used for diagnostic use only. It is used only to identify illness.
2. **What you need to know before DaTSCAN is used**

**DaTSCAN must not be used**
- if you are allergic to ioflupane or any of the other ingredients of this medicine (listed in section 6).
- if you are pregnant

**Warnings and precautions**
Talk to your nuclear medicine doctor before using DaTSCAN if you have a moderate or severe problems with your kidneys or liver.

**Children and adolescents**
DaTSCAN is not recommended for children aged 0 to 18 years

**Other medicines and DaTSCAN**
Tell your nuclear medicine doctor if you are taking or have recently taken any other medicines. Some medicines or substances can affect the way that DaTSCAN works.
These include:
- bupropion (used to treat depression (sadness))
- benztropine (used to treat Parkinson’s disease)
- mazindol (reduces appetite, as a means to treat obesity)
- sertraline (used to treat depression (sadness))
- methylphenidate (used to treat hyperactivity in children and narcolepsy (excessive sleepiness))
- phentermine (reduces appetite, as a means to treat obesity)
- amfetamine (used to treat hyperactivity in children and narcolepsy (excessive sleepiness); also a drug of abuse)
- cocaine (sometimes used as an anaesthetic for nose surgery; also a drug of abuse)

Some medicines may reduce the quality of the picture obtained. The doctor may ask you to stop taking them for a short time before you receive DaTSCAN.

**Pregnancy and breast-feeding**
Do not use DaTSCAN if you are pregnant or think you may possibly be pregnant. This is because the child may receive some of the radioactivity. Tell your nuclear medicine doctor if you think you might be pregnant. Alternative techniques which do not involve radioactivity should be considered.

If you are breast-feeding, your nuclear medicine doctor may delay the use of DaTSCAN, or ask you to stop breast-feeding. It is not known whether ioflupane (\(^{123}\)I) is passed into breast milk.
- You should not breast-feed your child for 3 days after DaTSCAN is given.
- Instead use formula feed for your child. Express your breast milk regularly and throw away any breast milk you have expressed.
- You will need to continue to do this for 3 days, until the radioactivity is no longer in your body.

**Driving and using machines**
DaTSCAN has no known influence on the ability to drive and use machines.

**DaTSCAN contains** alcohol (ethanol) 5% by volume. Each dose contains up to 197 mg alcohol. This is about the same as 5 ml beer, or 2 ml wine. This is harmful for those suffering from alcoholism and needs to be taken into account in pregnant or breastfeeding women, children and high risk groups such as patients with liver disease or epilepsy. Tell your doctor if any of these apply to you.
3. **How DaTSCAN is used**

There are strict laws on the use, handling and disposal of radioactivity. DaTSCAN will always be used in a hospital or a similar place. It will only be handled and given to you by people who are trained and qualified to use it safely. They should tell you anything you need to do for the safe use of this medicine. Your nuclear medicine doctor will decide the dose that is best for you.

Before you receive DaTSCAN, your nuclear medicine doctor will ask you to take some tablets or liquid that contain iodine. These stop the radioactivity building-up in your thyroid gland. It is important that you take the tablets or liquid as the doctor tells you.

DaTSCAN is given to you as an injection, usually into a vein in your arm. The recommended radioactivity given by injection is between 111 to 185 MBq (megabequerel or MBq is a unit used to measure radioactivity). A single injection is enough. The camera pictures are usually taken 3 to 6 hours after the injection of DaTSCAN.

**If you are given more DaTSCAN than you should**

Since DaTSCAN is given by a doctor under controlled conditions, it is unlikely that you will get an overdose. Your nuclear medicine doctor will suggest that you drink plenty of fluids to help the body get rid of the medicine. You will need to be careful with the water (urine) that you pass - your doctor will tell you what to do. This is normal practice with medicines like DaTSCAN. Any ioflupane (123I) which remains in your body will naturally lose its radioactivity.

If you have any further questions on the use of this medicine, ask your nuclear medicine doctor who supervises the procedure.

4. **Possible side effects**

Like all medicines, DaTSCAN can cause side effects, although not everybody gets them. The frequency of side effects is:

- **Common:** may affect up to 1 in 10 people
  - Headache

- **Uncommon:** may affect up to 1 in 100 people
  - Increased appetite
  - Dizziness
  - Taste disturbance
  - Nausea
  - Dry mouth
  - Vertigo
  - A brief irritating feeling similar to ants crawling over your skin (formication)
  - Intense pain on injection. This has been reported among patients receiving DaTSCAN into a small vein

- **Not known:** frequency cannot be estimated from the available data.
  - Hypersensitivity (allergic)

The amount of radioactivity in the body from DaTSCAN is very small. It will be passed out of the body in a few days without need for you to take special precautions.

**Reporting of side effects**

If you get any side effects, talk to your nuclear medicine doctor. This includes any possible side effects not listed in this leaflet. You can also report side effects directly via the national reporting system listed...
in Appendix V*. By reporting side effects you can help provide more information on the safety of this medicine.

5. **How DaTSCAN is stored**

You will not have to store this medicine. This medicine is stored under the responsibility of the specialist in appropriate premises. Storage of radiopharmaceuticals will be in accordance with national regulation on radioactive materials.

The following information is intended for the specialist only:

- Keep this medicine out of the sight and reach of children.
- Do not store above 25°C.
- Do not freeze.

Do not use this medicine after the expiry date, which is stated on the carton and vial after EXP. The expiry date refers to the last day of that month. Hospital staff will ensure that the product is stored and thrown away correctly and not used after the expiry date stated on the label.

6. **Contents of the pack and other information**

**What DaTSCAN contains**

- The active substance is ioflupane (\(^{123}\)I). Each ml of solution contains ioflupane (\(^{123}\)I) 74 MBq at reference time (0.07 to 0.13 μg/ml of ioflupane).
- The other ingredients are acetic acid, sodium acetate, ethanol and water for injections.

**What DaTSCAN looks like and contents of the pack**

DaTSCAN is a 2.5 or 5 ml colourless solution for injection, supplied in a single colourless 10 ml glass vial sealed with a rubber closure and metal overseal.
