## 21 **1. Introduction**

22 In the European pharmaceutical legislation, requirements are outlined for particulars and documents  
23 that should accompany an application for marketing authorisation of a biological medicinal product. All  
24 information, which is relevant to the evaluation of the medicinal product concerned, shall be included  
25 in the application. This includes also information related to the starting and raw materials used in the  
26 manufacture of a medicinal product.

27 In view of the general definition of what a biological medicinal product is in Annex 1 to Directive  
28 2001/83/EC, knowledge of the manufacturing process and its control is needed for the characterisation  
29 and determination of the quality for a biological medicinal product.<sup>i</sup> For biological medicinal products  
30 the interpretation of European legislation thus adheres to the principle of "one process = one product"  
31 as a general paradigm, i.e. the product is process specific.

32 It thus becomes relevant to clearly define where the manufacturing process starts and particularly  
33 whether starting materials from various sources are used. In 2007 the Co-ordination group for Mutual  
34 recognition and Decentralised procedures (CMDh) clarified the regulatory status as "biological  
35 medicinal product" for a group of medicinal substances derived from biological sources such as  
36 heparins, gonadotrophins and urokinase.<sup>ii</sup> Historically, for such products a certain level of flexibility  
37 may have been allowed in sourcing and initial processing steps. This applies also to products from non-  
38 recombinant origin that are considered as biological active substances/biological medicinal products in  
39 the current legislation (e.g. allergens).

40 This position statement addresses to which extent any variability in the early manufacturing steps for  
41 certain biological products would be acceptable.

## 42 **2. Problem statement**

43 The marketing authorisation dossier should include information that adequately describes the  
44 manufacturing process and process controls. Information on quality and control of all starting materials  
45 and process reagents used in the manufacture of a drug substance should be provided. For drug  
46 substances derived from biological starting materials special attention is drawn to clearance and  
47 control of adventitious agents and an appropriate safety evaluation of a medicinal product derived from  
48 it is requested.

49 The requirement that the MAH should have full access to Drug Substance manufacturing data implies  
50 that all manufacturing steps and manufacturing sites have to be covered in the marketing  
51 authorisation dossier. In particular, this causes complexity for products undergoing multi-source  
52 processes. Examples of such products are heparins (including Low Molecular Weight Heparins), urine  
53 derived products like gonadotropins and urokinases, and plasma derived medicinal products.

54 For these products, variability in sourcing and/or initial manufacturing steps has traditionally been  
55 allowed in contrast to the well characterised biotechnological products of recombinant origin for which  
56 the declared manufacturing process starts from a unique and well identified cell bank system. Such  
57 variability is triggered by the high demand for the starting material and consequential manufacturing  
58 and market logistics. For some products such as heparins there is an increasing difficulty on finding

---

<sup>i</sup> Directive 2001/83/EC, Annex 1 Active substance 3.2.1.1.b General information and information related to the starting and raw materials

<sup>ii</sup> CMDh Guidance for applicants on biologicals [available at <http://www.hma.eu/215.html>] and [http://www.hma.eu/fileadmin/dateien/Human\\_Medicines/CMD\\_h\\_/procedural\\_guidance/Compilation\\_Biological\\_Active\\_Substance\\_non-recombinant\\_origin.pdf](http://www.hma.eu/fileadmin/dateien/Human_Medicines/CMD_h_/procedural_guidance/Compilation_Biological_Active_Substance_non-recombinant_origin.pdf).

59 starting materials suppliers in the EU and there is a need for manufacturers/MAHs to source outside  
60 the EU (e.g. China). As manufacturers inevitably need to have several suppliers, flexibility of sourcing  
61 in the biological substances of non-recombinant origin may be needed to ensure product supply.

62 The multi-step manufacturing processes of biological substances have also caused differences in the  
63 definition of 'starting materials' for the drug substance manufacturing by both regulators and industry.  
64 Consequently, this resulted in differences in the level of detail for the early manufacturing steps  
65 presented in the marketing authorization dossier. This document clarifies the definition of starting  
66 materials for specific groups of biologicals and it presents CHMP's current position on the use of variant  
67 processes in the early manufacturing stages of these products.

### 68 **3. Scope**

69 This position statement addresses to what extent any variability may be acceptable in the early  
70 manufacturing steps for biological medicinal products which contain active substance extracted from  
71 organs, tissues or fluids from living organisms, either of animal or plant origin<sup>iii</sup> and for which flexibility  
72 of sourcing in the biological starting materials may be needed to ensure product supply. This document  
73 also clarifies the definition of starting materials for these products. A number of major examples are  
74 given which illustrate the concept of accepting process variability. The principles outlined in this  
75 document could be applied to other biological medicinal products for which flexibility of sourcing in the  
76 biological starting materials may be needed, e.g. porcine pancreas for insulin and pancreatin, and  
77 allergens. Advanced Therapy Medicinal Products (ATMP) are excluded from the scope of this document.

### 78 **4. Discussion**

79 The particulars and documents accompanying an application for marketing authorisation pursuant to  
80 Articles 8 and 10(1) shall be presented in accordance with the requirements set out in Annex I of  
81 Directive 2001/83/EC and shall follow the guidance published by the European Commission in The  
82 rules governing medicinal products in the European Community, Volume 2B, Notice to applicants,  
83 Medicinal products for human use, Presentation and content of the dossier, Common Technical  
84 Document (CTD).

#### 85 ***4.1 Starting materials and process intermediates***

86 According to Dir. 2001/83/EC, for biological medicinal products, "*starting materials shall mean any*  
87 *substance of biological origin such as micro-organisms, organs and tissues of either plant or animal*  
88 *origin, cells or fluids (including blood or plasma) of human or animal origin, and biotechnological cell*  
89 *constructs (cell substrates, whether they are recombinant or not, including primary cells)."*

90 Within the context of this document, a process intermediate is defined as a substance produced during  
91 steps of the processing of the drug substance that undergoes further molecular change or purification  
92 before it becomes the drug substance.

93 Any other substances such as reagents, culture media, foetal calf serum, additives, and buffers  
94 involved in chromatography, etc. used in the manufacturing or extraction of the active substance, but  
95 from which this active substance is not directly derived are defined as raw materials; therefore, these  
96 materials are outside the scope of this guidance document.

---

<sup>iii</sup> Volume 4 Good Manufacturing Practice, Medicinal Products for Human and Veterinary Use, Annex 2: Manufacture of Biological Medicinal Products for Human Use

97 Following the CMDh recommendations and in accordance with the requirements set out in Annex I of  
98 Dir. 2001/83/EC, it is not possible to use the Active Substance Master File (ASMF) procedure<sup>iv</sup> and  
99 existing CEPs cannot replace the relevant data in Module 3.<sup>v</sup> The main reason is that the MAH should  
100 have full access to the Drug Substance manufacturing data to take full responsibility for the medicinal  
101 product, all of its intermediate products and starting materials. Consequently, this data should be part  
102 of the marketing authorisation dossier for new and existing marketing authorisations.

103 Examples of three major classes of biological medicinal products are given below.

#### 104 Heparins

105 Heparin and derivatives fulfil the regulatory definition of 'biological substance' given by Directive  
106 2001/83/EC: the substance is of biological origin and, due to its complexity, a combination of physico-  
107 chemical-biological testing together with testing and control of the manufacturing process is needed for  
108 its characterisation and determination of quality.

109 Therefore, according to Dir. 2001/83/EC, porcine mucosa is defined as the starting material for any  
110 heparin or LMWH from porcine origin. Different process intermediates may exist and be qualified for  
111 use in the manufacture of LMWH, such as resin bound heparin, partly purified crude heparin or heparin  
112 sodium/calcium LMMH. However, these process intermediates shall not be considered as starting  
113 materials according to Directive 2001/83.

114 Module 3 of the marketing authorization dossier should cover the whole manufacturing process starting  
115 from the sourcing of the mucosa. Aspects with potential impact on product quality and safety needs to  
116 be presented in sufficient detail e.g. species and country of origin, traceability from  
117 slaughterhouses/abattoirs, confirmation that the animals used are fit for human consumption etc.

#### 118 Urine derived products

119 As for the heparins, urine derived products (e.g. urokinases, gonadotrophins) fulfil the definition of  
120 'biological substance'. Human urine should be defined as the starting material for urine derived  
121 medicinal products. Different process intermediates may exist. For example, (resin) adsorbed  
122 urokinase, urokinase paste, semi-purified urokinase have been described as process intermediates for  
123 medicinal products containing urokinase as the active substance. For the contents of module 3  
124 sufficient detail should be provided to enable a full assessment of the manufacturing steps to be made.

#### 125 Plasma derived products

126 The legal basis for EU minimum standards for the quality and safety of the starting material for  
127 plasma-derived medicinal products have been established along with the pharmaceutical legislation  
128 and specific provisions have been laid down in the pharmaceutical Directive 2001/83/EC as amended.  
129 The starting material for fractionation is plasma (pool) which is obtained from either recovered or  
130 source human plasma.

131 According to the recently revised guideline on plasma-derived medicinal products  
132 (EMA/CHMP/BWP/706271/2010), an intermediate plasma fraction (intermediate) is a partially  
133 fractionated starting material which must undergo further manufacturing steps before it becomes a  
134 bulk product or final product. Intermediates, commonly used for further processing into a final product,  
135 are fractions recovered from the process for the manufacturing of clotting factors (e.g. cryopaste) or

<sup>iv</sup> CMDh Guidance for applicants on biologicals [available at <http://www.hma.eu/215.html>]

<sup>v</sup> Report from the CMDh meeting held on 16-18 November 2009 [available at <http://www.hma.eu/259.html>], CHMP Monthly report November 2009 [available at [http://www.ema.europa.eu/docs/en\\_GB/document\\_library/Committee\\_meeting\\_report/2009/12/WC500016941.pdf](http://www.ema.europa.eu/docs/en_GB/document_library/Committee_meeting_report/2009/12/WC500016941.pdf)], and guideline on ASMF : CPMP/QWP/227/02 Rev2 [available at [http://www.ema.europa.eu/docs/en\\_GB/document\\_library/Scientific\\_guideline/2009/09/WC500002811.pdf](http://www.ema.europa.eu/docs/en_GB/document_library/Scientific_guideline/2009/09/WC500002811.pdf)]

136 from the manufacturing process of immunoglobulins or albumin (e.g. fractions II, III, IV, V), and may  
137 be prepared and stored by the product manufacturer or obtained from another supplier, a contract  
138 manufacturer.

139 The collection and control of starting materials for the manufacturing of an intermediate plasma  
140 fraction are important factors in the assurance of its quality. Information up to and including the  
141 manufacturing of the plasma pool should be provided in the Plasma Master File or in the dossier  
142 following the Guideline on the Scientific Data Requirements for a Plasma Master File  
143 (EMA/CHMP/BWP/3794/03). This information and information on the manufacture of the intermediate  
144 from the plasma pool should be provided to the manufacturer of the finished product.

145 For plasma-derived medicinal products, a variant of an established process may be employed if it  
146 concerns an intermediate plasma fraction.

#### 147 **4.2 Variant manufacturing processes**

148 When defining tissues, fluids such as urine or plasma as the starting material of the manufacturing  
149 process it is acknowledged that some flexibility within the "one process = one product" paradigm might  
150 be needed for the very early drug substance manufacturing steps. Indeed, for the above mentioned  
151 examples, large volumes or quantities of starting materials (urine, porcine mucosa, human plasma)  
152 have to be collected and pre-treated before initiating the final drug substance manufacturing steps  
153 which will result in drug substance with the desired quality. These first steps of collection, testing and  
154 pre-treatment of the starting material may be carried out by different suppliers who could apply  
155 different processes to obtain an "early intermediate".

156 The approach of an "early intermediate", derived from the same starting material but using variant  
157 manufacturing processes should however be well defined and its quality control and qualification a key  
158 step in the manufacturing process of the drug substance.

159 If multiple processes are used in the early stages, the MAH should justify the use of intermediate(s)  
160 manufactured by variant processes.

161 Full information about the manufacturing process, starting from the sourcing of the starting material  
162 (e.g. mucosa, urine, human plasma) should be given for each intermediate. Relevant Quality Attributes  
163 for each intermediate (e.g. purity profile, biological activity) should characterise the manufacturing  
164 process and should be defined by the manufacturer of the drug substance. Any differences among  
165 variant processes, e.g. additional purification/extraction step, process conditions, intermediates,  
166 materials and equipment, should be listed and justified for each intermediate. Provided that the  
167 intermediate from variant processes is sufficiently characterised, and that the final steps of the  
168 manufacturing process of the drug substance is robust enough (and validated) to obtain a comparable  
169 drug substance irrespective of the initial process steps or intermediate used, the application of variant  
170 processes in early drug substance manufacturing steps is acceptable for the type of products that are  
171 within the scope of this document.

172 Thus, if a manufacturer decides to use starting materials or intermediates from different sources and /  
173 or a different manufacturing process for the early production steps it should be shown that comparable  
174 products are consistently obtained in terms of relevant quality attributes irrespective of the process  
175 applied.

176 Comparability should also be demonstrated taking into account the principles laid down in guidance  
177 [(Note for Guidance for Biotechnological/Biological Products Subject to Changes in their Manufacturing  
178 Process (CPMP/ICH/5721/03)]. Discernable differences in quality attributes should be discussed and  
179 justified in terms of product quality (e.g. product heterogeneity) as well as safety (including virus

180 safety) and efficacy of the finished product. The extent of the studies necessary to demonstrate  
181 comparability will depend on (1) the complexity of the biological drug substance for example the  
182 quality attributes of heparin are well defined but those of urokinase are less well defined, and (2) how  
183 early in the production process a different intermediate is introduced. Any storage periods for  
184 intermediates should be set and justified by stability data.

185 Additional measures are taken for plasma-derived products as regards to risk of transmission of  
186 infectious agents, in accordance with the guideline on plasma-derived medicinal products  
187 (EMA/CHMP/BWP/706271/2010).

188 GMP measures (e.g. contract between supplier and manufacturer of medicinal product, audit system)  
189 should be adequate to ensure an appropriate control while allowing sourcing of starting materials or  
190 early intermediate biological products in different locations from third countries. Reference is made to  
191 Volume 4 EU Guidelines for Good Manufacturing Practice for Medicinal Products for Human and  
192 Veterinary Use Annex 2: Manufacture of Biological Medicinal Substances and Products for Human, Part  
193 B.
