2 EMA/CHMP/337820/2016
3 Committee for Medicinal Products for Human Use (CHMP)

4 **Guideline on core SmPC and Package Leaflet for gadoteric**
5 **acid**
6 **Draft**

Draft agreed by Radiopharmaceutical Drafting Group	April 2016
Adopted by CHMP for release for consultation	26 May 2016
Start of public consultation	1 June 2016
End of consultation (deadline for comments)	30 September 2016

7
8 Comments should be provided using this [template](#). The completed comments form should be sent to radiopharmaceuticalsDG@ema.europa.eu.

8
9 **Keywords** *Magnetic resonance, contrast media, gadolinium compounds, core SmPC, core Package Leaflet, gadoteric acid*

10 **Guideline on core SmPC and Package Leaflet for gadoteric**
11 **acid**

12 **Table of contents**

13 **Executive summary 3**
14 **1. Introduction (background) 3**
15 **2. Scope..... 3**
16 **3. Legal basis 3**
17 **4. Core SmPC and Package Leaflet for gadoteric acid 3**

18

19 **Executive summary**

20 This guideline describes the information to be included in the Summary of Products Characteristics
21 (SmPC) and package leaflet for gadoteric acid.

22 **1. Introduction (background)**

23 The purpose of this core SmPC and package leaflet is to provide applicants and regulators with
24 harmonised guidance on the information to be included in the Summary of product characteristics
25 (SmPC) gadoteric acid¹. This guideline should be read in conjunction with the QRD product information
26 templates and the guideline on Summary of Product Characteristics.

27 This Core SmPC has been prepared on the basis, and taking into account the available published
28 scientific literature. However, any new application or extension of indications for a contrast agent
29 product containing gadoteric acid should be submitted with all the required data in order to be valid.
30 For any new indication that is not in the core SmPC, it should be supported by appropriate efficacy and
31 safety data.

32 **2. Scope**

33 This core SmPC and package leaflet covers gadoteric acid.

34 **3. Legal basis**

35 This guideline has to be read in conjunction with Article 11 of Directive 2001/83 as amended, and the
36 introduction and general principles (4) and part I of the Annex I to Directive 2001/83 as amended.

37 **4. Core SmPC and Package Leaflet for gadoteric acid**

38

¹Concept paper on the harmonisation and update of the clinical aspects in the authorised conditions of use for radiopharmaceuticals and other diagnostic medicinal products (EMA/CHMP/EWP/12052/2008)

ANNEX I
SUMMARY OF PRODUCT CHARACTERISTICS

65 <▼ This medicinal product is subject to additional monitoring. This will allow quick identification of
66 new safety information. Healthcare professionals are asked to report any suspected adverse reactions. See
67 section 4.8 for how to report adverse reactions.> [For medicinal products subject to additional monitoring
68 ONLY]
69
70

71 1. NAME OF THE MEDICINAL PRODUCT

72 {(Invented) name 0.5 mmol/mL solution for injection <in prefilled syringe/cartridge>}

76 2. QUALITATIVE AND QUANTITATIVE COMPOSITION

77
78 1 mL solution for injection contains 279.32 mg gadoteric acid (as meglumine salt), equivalent to 0.5
79 mmol., equivalent to ... mg gadolinium.

80 For the full list of excipients, see section 6.1.
81
82

83 3. PHARMACEUTICAL FORM

84 Solution for injection

85 Clear colourless to yellow solution

86 pH *[Product specific]*

87 Viscosity [mPa s] 20 °C *[Product specific]*

88 37 °C *[Product specific]*

89 Osmolality at 37 °C [mOsm/kg H₂O] *[Product specific]*
90
91
92

93 4. CLINICAL PARTICULARS

95 4.1 Therapeutic indications

96 This medicinal product is for diagnostic use only.
97
98

99 Gadoteric acid is a contrast agent indicated for
100

101 Enhancement of the contrast in Magnetic Resonance Imaging (MRI) for a better visualization/delineation:

- 102 - MRI of the CNS including lesions of the brain, spine, and surrounding tissues
- 103 - Whole body MRI including lesions of the liver, kidneys, pancreas, pelvis, lungs, heart, breast, and
104 musculoskeletal system.
- 105 - MR angiography including lesions or stenoses of the non-coronary arteries.
106

107 4.2 Posology and method of administration

108 This medicinal product should only be administered by trained healthcare professionals with technical
109 expertise in performing and interpreting gadolinium enhanced MRI.
110
111

112 Posology

113
114 The recommended dose for intravenous injection in adults is 0.2 mL/kg body weight (BW) (equivalent to
115 0.1 mmol/kg BW) to provide diagnostically adequate contrast.
116

117 *Encephalic and spinal MRI*

118 In patients with brain tumors, an additional dose of 0.4 mL/kg BW (equivalent to 0.2 mmol/kg BW) may
119 improve tumor characterisation and facilitate therapeutic decision making.

120

121 *Angiography*

122 In exceptional circumstances (e.g. failure to gain satisfactory images of an extensive vascular territory)
123 administration of a second consecutive injection of 0.2 mL/kg body weight (BW) (equivalent to 0.1
124 mmol/kg BW) may be justified. However, if the use of 2 consecutive doses of gadoteric acid is anticipated
125 prior to commencing angiography, use of 0.1 mL/kg BW (equivalent 0.05 mmol/kg BW) to for each dose
126 may be of benefit, depending on the imaging equipment available.

127

128 *Renal impairment*

129 The adult dose applies to patients with mild to moderate renal impairment ($GFR \geq 30 \text{ mL/min/1.73m}^2$).
130 Gadoteric acid should only be used in patients with severe renal impairment ($GFR < 30 \text{ mL/min/1.73m}^2$)
131 and in patients in the perioperative liver transplantation period after careful risk/benefit assessment and if
132 the diagnostic information is essential and not available with non-contrast enhanced MRI (see section 4.4).
133 If it is necessary to use Gadoteric acid, the dose should not exceed 0.2 mL/kg body weight (BW)
134 (equivalent to 0.1 mmol/kg BW). More than one dose should not be used during a scan. Because of the
135 lack of information on repeated administration, Gadoteric acid injections should not be repeated unless the
136 interval between injections is at least 7 days.

137

138 *Elderly (aged 65 years and above)*

139 No dosage adjustment is considered necessary. Caution should be exercised in elderly patients (see
140 section 4.4).

141

142 *Impaired hepatic function*

143 The adult dose applies to these patients. Caution is recommended, especially in the case of perioperative
144 liver transplantation period (see above impaired renal function).

145 The 0.1 mmol/kg BW dose applies to all indications except angiography.

146

147 *Children*

148 The 0.2 mL/kg body weight (BW) (equivalent to 0.1 mmol/kg BW) dose applies to all indications except
149 angiography. Gadoteric acid is not recommended for angiography in children under 18 years of age due to
150 insufficient data on efficacy and safety in this indication.

151 Due to immature renal function in neonates up to 4 weeks of age and infants up to 1 year of age, Gadoteric
152 acid should only be used in these patients after careful consideration at a dose not exceeding 0.2 mL/kg
153 body weight (BW) (equivalent to 0.1 mmol/kg BW). More than one dose should not be used during a
154 scan. Because of the lack of information on repeated administration, Gadoteric acid injections should not
155 be repeated unless the interval between injections is at least 7 days.

156 Use for whole body MRI is not recommended in children less than 6 months of age.

157

158 Method of administration

159

160 The product is indicated for intravenous administration only.

161

162 Infusion rate: 3-5 mL/min (higher infusion rates up to 120 mL/min, i.e. 2 mL/sec, may be used for
163 angiographic procedures).

164

165 Intravascular administration of contrast media should, if possible, be done with the patient lying down.
166 After the administration, the patient should be kept under observation for at least half an hour, since
167 experience shows that the majority of undesirable effects occur within this time.

168

169 For single patient use only, any unused solution should be discarded.

170

171 Image acquisition

172 Contrast enhanced MRI may be initiated immediately after administration of the agent. Optimal imaging:
173 within 45 minutes after injection. Optimal image sequence: T1-weighted
174

175 **4.3 Contraindications**

176

177 Previous anaphylactic reaction to gadolinium, to the active substance or to any of the excipients listed in
178 section 6.1.

179

180 **4.4 Special warnings and precautions for use**

181

182 Do not use by intrathecal route. Take care to maintain strictly intravenous injection: extravasation may
183 result in local intolerance reactions, requiring the usual local care.

184

185 Appropriate facilities should be readily available for coping with any complication of the procedure, as
186 well as for emergency treatment of severe reaction to the contrast agent itself (e.g. hypersensitivity,
187 seizures).

188

189 Potential for hypersensitivity or anaphylactic reactions

190 All MRI contrast products can cause minor or major hypersensitivity reactions, characterised by
191 cardiovascular, respiratory and cutaneous manifestations, which can be life-threatening. Most of these
192 reactions occur immediately (within 30min) or in rare cases delayed (after hours or days).

193

194 Severe reactions, including anaphylactic shock, occur very rarely. Anaphylactic reactions are immediate
195 and can lead to death. They are independent of the dose, may occur upon the first administration of the
196 product, and are often unforeseeable. The risk of a major reaction makes it necessary to have immediate
197 access to the resources necessary for emergency life support.

198

199 If hypersensitivity reactions occur, the administration of the contrast agent must be discontinued
200 immediately and, if necessary, intravenous treatment initiated. The insertion of a flexible in-dwelling
201 catheter is recommended during the entire examination. Medication and equipment for the treatment of
202 hypersensitivity reactions must be ready for use.

203

204 Patients with either previous reaction to contrast media, history of bronchial asthma or other allergic
205 disposition, have an increased risk of hypersensitivity reactions.

206

207 *Before administration of the contrast agent*

- 208 - ask the patient about previous reactions to contrast media or allergies,
- 209 - consider premedication with antihistamines and/or glucocorticoids in patients with the highest risk /
210 known intolerance. However, they cannot prevent the occurrence of serious or fatal anaphylactic
211 shock.

212

213 *Throughout the examination*

- 214 - provide medical monitoring
- 215 - maintain a venous access for emergency treatment in the event of a reaction.

216

217 *After administration of the contrast agent*

- 218 - competent personnel, drugs and equipment for emergency resuscitation must be available and the
219 patient should remain under observation at least 30 minutes, because the majority of serious adverse
220 effects occur within this interval.
- 221 - The patient should be informed of the possibility of delayed reactions.

222

223 Patients taking beta-blockers who experience such reactions may be resistant to treatment with beta-
224 agonists.

225

226 Patients with cardiovascular disease are more susceptible to serious even fatal outcomes of severe
227 hypersensitivity reactions.

228

229 Patients with central nervous system disorders

230 Patients with a history of convulsions or intracranial lesions may be at increased risk of seizure activity
231 during the examination, although this has rarely been observed in association with gadoteric acid
232 administration. Precautionary measures should be taken, e.g. close monitoring, all equipment and drugs
233 necessary to manage convulsions should they occur, must be ready for use.

234

235 Impaired renal function

236 Prior to administration of gadoteric acid, all patients should be screened for renal dysfunction by obtaining
237 laboratory tests.

238

239 There have been reports of nephrogenic systemic fibrosis (NSF) associated with use of some gadolinium-
240 containing contrast agents in patients with acute or chronic severe renal impairment (GFR < 30
241 mL/min/1.73m²). Patients undergoing liver transplantation are at particular risk since the incidence of
242 acute renal failure is high in this group. As there is a possibility that NSF may occur with Gadoteric acid,
243 it should therefore only be used in patients with severe renal impairment and in patients in the
244 perioperative liver transplantation period after careful risk/benefit assessment and if the diagnostic
245 information is essential and not available with non-contrast enhanced MRI.

246

247 Haemodialysis shortly after gadoteric acid administration may be useful at removing gadoteric acid from
248 the body. There is no evidence to support the initiation of haemodialysis for prevention or treatment of
249 NSF in patients not already undergoing haemodialysis.

250

251 Paediatric population (Neonates and infants)

252

253 Due to immature renal function in neonates up to 4 weeks of age and infants up to 1 year of age, Gadoteric
254 acid should only be used in these patients after careful consideration.

255 In neonates and infants the required dose should be administered by hand.

256

257 Elderly

258

259 As the renal clearance of gadoteric acid may be impaired in the elderly, it is particularly important to
260 screen patients aged 65 years and older for renal dysfunction.

261 Cardiovascular disease

262

263 In patients with severe cardiovascular disease Gadoteric acid should only be administered after careful
264 risk benefit assessment because only limited data are available so far.

265

266 CNS disorders

267

268 Like with other gadolinium containing contrast agents special precaution is necessary in patients with a
269 low threshold for seizures. Precautionary measures should be taken, e.g. close monitoring. All equipment
270 and drugs necessary to counter any convulsions which may occur must be made ready for use beforehand.

271

272 Patient preparation

273 Nausea and vomiting are known possible undesirable effects when using MRI contrast agents. The patient
274 should therefore refrain from eating for 2 hours prior to the investigation.

275

276 Excipients

277 <This medicinal product contains sodium. The level of sodium is less than 1 mmol per bottle, essentially
278 “sodium-free”.>

279

280 **4.5 Interaction with other medicinal products and other forms of interaction**

281
282 No interaction studies with other medicinal products have been performed.
283

284 Beta-blockers, vasoactive substances, angiotensin-converting enzyme inhibitors, angiotensin receptor
285 antagonists: These medicinal products induce decreased efficacy of cardiovascular compensation
286 mechanisms of blood pressure changes. The application of contrast media may increase the incidence of
287 hypersensitivity reactions in patients taking beta-blockers (see section 4.4).
288

289 **4.6 Fertility, pregnancy and lactation**

290 Pregnancy

291
292 There are no data from the use of gadoteric acid in pregnant women. Animal studies do not indicate direct
293 or indirect harmful effects with respect to reproductive toxicity (see section 5.3).

294 Gadoteric acid should not be used during pregnancy unless the clinical condition of the woman requires
295 use of gadoteric acid.
296

297 Lactation

298
299 Gadolinium containing contrast agents are excreted into breast milk in very small amounts (see section
300 5.3). At clinical doses, no effects on the infant are anticipated due to the small amount excreted in milk
301 and poor absorption from the gut. Continuing or discontinuing breast feeding for a period of 24 hours after
302 administration of Gadoteric acid, should be at the discretion of the doctor and lactating mother.
303

304 Fertility

305
306 There are no clinical data available with regard to effects on fertility.
307

308 **4.7 Effects on ability to drive and use machines**

309
310 No studies on the effects on the ability to drive and use machines have been performed. Ambulant patients
311 while driving vehicles or operating machinery should take into account that nausea may incidentally
312 occur.
313

314 **4.8 Undesirable effects**

315 Summary of the safety profile

316
317 The adverse drug reactions (ADRs) associated with the use of gadoteric acid are usually of mild to
318 moderate severity and transient. A sensation of heat, cold and/or pain at the injection site are the most
319 frequently observed reactions.
320

321
322 During clinical trials, headache and paresthesia were very commonly observed ($>1/10$), and nausea,
323 vomiting and skin reactions such as erythematous rash and pruritus were commonly observed ($>1/100$ -
324 $<1/10$). Since post-marketing, the most commonly reported adverse reactions following administration of
325 gadoteric acid are nausea, vomiting, pruritus and hypersensitivity reactions.
326

327 Tabulated list of ADRs

328
329 The adverse reactions are listed in the table below by SOC (System Organ Class) and by frequency with
330 the following guidelines: very common ($\geq 1/10$), common ($\geq 1/100$ to $<1/10$), uncommon ($\geq 1/1000$ to
331 $<1/100$), rare ($\geq 1/10000$ to $<1/1000$), very rare ($<1/10000$), not known (cannot be estimated from the
332 available data). The data presented are from clinical trials when available, or from an observational study
333 involving 82,103 patients.
334
335

System Organ Class	Frequency: adverse reaction
Immune system disorders	Uncommon: hypersensitivity, anaphylactic reaction, anaphylactoid reaction
Psychiatric disorders	Very rare: agitation, anxiety
Nervous system disorders	Very common: paraesthesia, headache Rare: dysgeusia Very rare: coma, convulsion, syncope, presyncope, dizziness, parosmia, tremor
Eye disorders	Very rare: conjunctivitis, ocular hyperaemia, vision blurred, lacrimation increased, eyelid edema
Cardiac disorders	Very rare: cardiac arrest, bradycardia, tachycardia, arrhythmia, palpitations
Vascular disorders	Very rare: hypotension, hypertension, vasodilatation, pallor
Respiratory, thoracic and mediastinal disorders	Very rare: respiratory arrest, pulmonary oedema, bronchospasm, laryngospasm, pharyngeal oedema, dyspnoea, nasal congestion, sneezing, cough, dry throat
Gastrointestinal disorders	Common: nausea, vomiting Very rare: diarrhoea, abdominal pain, salivary hypersecretion
Skin and subcutaneous tissue disorders	Common: pruritus, erythema, rash Rare: urticaria, hyperhidrosis, Very rare: eczema, angioedema Not known: nephrogenic systemic fibrosis
Musculoskeletal and connective tissue disorders	Very rare: muscle contracture, muscular weakness, back pain
General disorders and administration site conditions	Common: feeling hot, feeling cold, injection site pain Very rare : malaise, thoracic pain, chest discomfort, fever, chills, face oedema, asthenia, injection site discomfort, injection site reaction, injection site oedema, injection site extravasation, injection site inflammation (in case of extravasation), injection site necrosis (in case of extravasation), superficial phlebitis
Investigations	Very rare: decreased oxygen saturation

336

337

338 Description of selected ADRs

339

340 In hypersensitivity reactions, the reactions most frequently observed are skin reactions, which can be
341 localized, extended or generalized.

342 These reactions occur most often immediately (during the injection or within one hour after the start of
343 injection) or sometimes delayed (one hour to several days after injection), presenting as skin reactions in
344 this case.

345

346 Immediate reactions include one or more effects, which appear simultaneously or sequentially, which are
347 most often cutaneous, respiratory and/or cardiovascular reactions. Each sign may be a warning sign of a
348 starting shock and go very rarely to death.

349

350 Isolated cases of nephrogenic systemic fibrosis (NSF) have been reported with gadoteric acid, most of
351 which were in patients co-administered other gadolinium-containing contrast agents (see section 4.4).

352

353 Adverse events related to gadoteric acid are uncommon in children. The expectedness of these events is
354 identical to that of the events reported in adults (see section 4.2 and 4.4).

355

356 Reporting of suspected adverse reactions

357

358 Reporting suspected adverse reactions after authorisation of the medicinal product is important. It allows
359 continued monitoring of the benefit/risk balance of the medicinal product. Healthcare professionals are
360 asked to report any suspected adverse reactions via the national reporting system listed in [Appendix V](#)*.

361
362 *[*For the printed material, please refer to the guidance of the annotated QRD template.]*
363

364 **4.9 Overdose**

365
366 Gadoteric acid can be removed by haemodialysis. However there is no evidence that haemodialysis is
367 suitable for prevention of nephrogenic systemic fibrosis (NSF).
368

370 **5. PHARMACOLOGICAL PROPERTIES**

371 **5.1 Pharmacodynamic properties**

372
373 Pharmacotherapeutic group: Magnetic resonance imaging contrast media, paramagnetic contrast media,
374 ATC-Code: V08CA02
375

376
377 Gadoteric acid is a paramagnetic agent for Magnetic Resonance Imaging (MRI).
378

379 The contrast-enhancing effect is mediated by gadoteric acid which is a ionic gadolinium complex
380 composed out of Gadolinium oxide and 1,4,7,10 tetraazacyclododecane- N,N',N'',N''' tetraacetic acid
381 (Dota), and present as meglumine salt.
382

383 The paramagnetic effect (relaxivity) is determined from the effect on spin-lattice relaxation time (T1)
384 about $3.4 \text{ mmol}^{-1}\text{Lsec}^{-1}$ and on the spin-spin relaxation time (T2) about $4.27 \text{ mmol}^{-1}\text{Lsec}^{-1}$.
385

386 Gadoteric acid provides contrast enhancement and facilitates visualisation of abnormal structures or
387 lesions in various parts of the body including the CNS.
388

389 **5.2 Pharmacokinetic properties**

390 Distribution

391
392
393 After intravenous administration gadoteric acid is rapidly distributed in the extracellular space. The
394 distribution volume was approx. 18 l which is approximately equal to the volume of extra-cellular fluid.
395 Gadoteric acid does not bind to proteins like serum albumin.
396

397 Biotransformation

398
399 No metabolites were detected.
400

401 Elimination

402
403 Gadoteric acid is eliminated rapidly (89% after 6 h, 95% after 24 h) in unchanged form through the
404 kidneys by glomerular filtration. Excretion via the feces is negligible. The elimination half life amounts to
405 about 1.6 hours in patients with a normal renal function. In renally impaired patients, the elimination half
406 life was increased to approximately 5 hours for a creatinine clearance between 30 and 60 mL/min and
407 approximately 14 hours for a creatinine clearance between 10 and 30 mL/min.
408

409 In animal experiments it has been demonstrated that gadoteric acid can be removed by dialysis.
410

411 In patients with normal renal function, the plasmatic half life is about 90 minutes. It is eliminated by
412 glomerular filtration in unchanged form.

413
414 Gadoteric acid is poorly excreted in the milk and cross slowly through the placenta barrier.

415
416 Special characteristics in patients with restricted kidney function

417
418 The plasmatic clearance is reduced in case of renal impairment.

419
420 **5.3 Preclinical safety data**

421
422 Non-clinical data reveal no special hazard for humans based on conventional studies of safety
423 pharmacology, repeated dose toxicity, genotoxicity or toxicity to reproduction.

424
425 Animal studies have shown negligible (less than 1 % of the administered dose) secretion of gadoteric acid
426 in maternal milk.

427
428
429 **6. PHARMACEUTICAL PARTICULARS**

430
431 **6.1 List of excipients**

432
433 *[Product specific]*

434
435 **6.2 Incompatibilities**

436
437 In the absence of compatibility studies, this medicinal product must not be mixed with other medicinal
438 products.

439
440 **6.3 Shelf life**

441
442 *[Product specific]*

443
444 Chemical and physical in-use stability has been demonstrated for [...] hours at [...]°C. From a
445 microbiological point of view, the product should be used immediately. If not used immediately, in-use
446 storage times and conditions prior to use are the responsibility of the user and would normally not be
447 longer than [...] hours at 2 °C to 8 °C.

448
449 **6.4 Special precautions for storage**

450
451 This medicinal product does not require any special storage conditions.

452
453 **6.5 Nature and contents of container**

454
455 *[Product specific]*

456
457 **6.6 Special precautions for disposal and other handling**

458
459 The solution for injection should be inspected visually prior to use. Solutions with visible signs of
460 deterioration (such as particles in the solution, fissures in the vial) must not be used.

461
462 The peel-off tracking label on the vials//bottles should be stuck onto the patient record to enable accurate
463 recording of the gadolinium contrast agent used. The dose used should also be recorded.

464
465 Any unused portions and waste material derived from disposal and items which come into contact with the
466 product when administering this product with an automatic application system should be disposed of in
467 accordance with local requirements.

B. PACKAGE LEAFLET

Package leaflet: Information for the user

{(Invented) name 500 micromol/mL solution for injection <in prefilled syringe/cartridge>
{gadoteric acid}}

<▼ This medicine is subject to additional monitoring. This will allow quick identification of new safety information. You can help by reporting any side effects you may get. See the end of section 4 for how to report side effects.> [For medicinal products subject to additional monitoring ONLY]

Read all of this leaflet carefully before you start using this medicine because it contains important information for you.

- Keep this leaflet. You may need to read it again.
- If you have any further questions, ask your radiologist/doctor who will supervise the procedure.
- If you get any side effects talk to your radiologist/doctor. This includes any possible side effects not listed in this leaflet.

What is in this leaflet

What is in this leaflet

1. What {X} is and what it is used for
2. What you need to know before you are given {X}
3. How {X} is used
4. Possible side effects
5. How to store {X}
6. Contents of the pack and other information

1. What X is and what it is used for

{X} contains gadoteric acid, a product which enhances contrast. It is for diagnostic use only.

{X} is used used to enhance the contrast of the images obtained in examinations with Magnetic Resonance Imaging (MRI). This contrast enhancement improves the visualisation and delineation of:

- MRI of the CNS including defects (lesions) in brain, spinal cord and adjacent tissue;
- Whole body MRI including defects (lesions) in liver, kidneys, pancreas, pelvis, lungs, heart, breast and musculoskeletal system;
- MR angiography including defects (lesions) and narrowing (stenosis) in arteries, except in coronary arteries.

2. What you need to know before you <take> <use> X

You must not be given {X}:

- if you are allergic (hypersensitive) to gadolinium, gadoteric acid or any of the other ingredients of {X}.

Warnings and precautions

Remove all metallic objects you may wear before the examination.

Tell your radiologist/doctor

- if you have a heart pacemaker, an iron-based (ferromagnetic) clip an implant or an insulin pump, or any suspected metallic foreign bodies, particularly in the eye please. It is a condition where MRI is not suitable.

- 586 - if you have, or if you have ever had, bronchial asthma or other allergies (such as seafood allergy,
587 urticaria, hay fever) or a previous allergic reaction to contrast media you may be more likely to have
588 an allergic reaction during the examination. You may be given another medicine before the
589 examination to prevent them.
- 590 - if you are taking a beta-blocker (medicines used against high blood pressure, heart problems and other
591 conditions). Patients treated with beta-blockers do not necessarily respond to other medicines usually
592 used for the treatment of allergic reactions.
- 593 - your kidneys do not work properly. Your doctor or radiologist may decide to take a blood test to check
594 how well your kidneys are working before making the decision to use {X}, especially if you are 65
595 years of age or older.
- 596 - you have a disease affecting your heart or your blood vessels (e. g. severe heart failure, coronary
597 artery disease) you are more susceptible to serious or even fatal outcomes of severe allergic reactions.
- 598 - you have had convulsions or you are being treated for epilepsy you may have an increased risk of
599 suffering from one during the examination.
- 600 - you have recently had, or soon expect to have, a liver transplant

601

602 In all these cases, your doctor or radiologist will assess the benefit-to-risk ratio and decide whether you
603 should be given {X}. If you are given {X}, your doctor or radiologist will take the precautions necessary
604 and the administration of {X} will be carefully monitored.

605

606 **Children**

607

608 Neonates and infants

609 As kidney function is immature in babies up to 4 weeks of age and infants up to 1 year of age, {X} will
610 only be used in these patients after careful consideration by the doctor.

611

612 **Other medicines and {X}**

613 Tell your doctor or radiologist if you are taking or have recently taken any other medicines. In particular,
614 please inform your doctor, radiologist or pharmacist if you are taking or have recently taken medicines for
615 heart and blood pressure disorders such as beta-blocking agents (such as metoprolol), vasoactive
616 substances (such as doxazosin), angiotensin-converting enzyme inhibitors (such as ramipril), angiotensin
617 II receptor antagonists (such as valsartan).

618

619 **{X} with food and drink**

620 There are no known interactions between {X} and food and drinks. However, please check with your
621 doctor, radiologist or pharmacist if it is required not to eat anything for 2 hours prior to the investigation.

622

623 **Pregnancy**

624 You must tell your doctor or radiologist if you think you are or might become pregnant as {X} should not
625 be used during pregnancy unless strictly necessary.

626

627 **Breast-feeding**

628 Your doctor or radiologist will discuss whether you should continue breast-feeding or interrupt breast-
629 feeding for a period of 24 hours after you receive {X} .

630

631 **Driving and using machines**

632 Your injection is unlikely to affect your ability to drive a car or to operate machines. However, while
633 driving vehicles or operating machines you should take account that nausea or low blood-pressure may
634 incidentally occur. If you feel unwell after the examination, you should not drive or use machines.

635

636

637 **3. How to <take> <use> X**

638

639 {X} will be given by an authorised healthcare professional directly into a vein (intravenously).

694

During the examination, you will be under the supervision of a doctor or radiologist. A needle will be left in your vein; this will allow the doctor or radiologist to inject you with appropriate emergency drugs if necessary. If you experience an allergic reaction, the administration of {X} will be stopped.

{X} can be administered by hand or by the mean of an automatic injector. In children, the product will only be administered by hand.

The procedure will be carried out in a hospital, clinic or private practice. The attending staff know what precautions have to be taken for the examination. They are also aware of the possible complications that can occur.

After the examination you will be kept under supervision for at least 30 minutes after the injection by your radiologist/doctor. This is the time where most undesired reactions (e. g. allergic reactions) may occur. However, in rare cases, reactions may occur after hours or days.

Dosage

Your doctor or radiologist will determine the dose you will receive and supervise the injection.

Adults, adolescents and children (over the age of two years)

The dose for cranial, spinal and whole body MRI used will depend on the type of lesion that is being investigated but it is usually between 0.2 and 0.6 mL/kg body weight for adults and 0.2 mL/kg body weight for children.

If this medicinal product is intended to be used with an automatic application system, its suitability for the intended use has to be demonstrated by the manufacturer of the medical device. Instructions for use of the medical device must be followed absolutely.

This medicinal product is for single use only.

Dosage in special patient groups

Patients with impaired renal function

You should not be given {X} if you suffer from severe kidney problems or if you are a patient who is about to have or has recently had a liver transplant. However if use is required you should only receive one dose of {X} during a scan and you should not receive a second injection for at least 7 days.

Neonates, infants, children and adolescents

As kidney function is immature in babies up to 4 weeks of age and infants up to 1 year of age, {X} will only be used in these patients after careful consideration by the doctor. Neonates and infants should only receive one dose of {X} during a scan and should not receive a second injection for at least 7 days.

Use for angiography is not recommended in children less than 18 years of age.

Use for whole body MRI is not recommended in children less than 6 months of age.

Elderly

It is not necessary to adjust your dose if you are 65 years of age or older but you may have a blood test to check how well your kidneys are working.

If you are given more {X} than you should

This medicine will be given to you by a healthcare professional. If you think that you have received too much medicine please tell your doctor or nurse immediately. In case of overdose, {X} can be removed from the body by haemodialysis (blood cleaning).

695 If you have any further questions on the use of this product, ask your doctor or radiographer or pharmacist.

696

697

698 **4. Possible side effects**

699

700 Like all medicines, this medicine can cause side effects, although not everybody gets them.

701

702 The most commonly reported side effects with {X} are:

703 Very common side effects (may affect more than 1 in 10 people): headaches, tingling sensation

704 Common side effects (may affect up to 1 in 10 people): sensation of warmth or cold and/or pain at
705 the injection site, nausea (feeling sick), vomiting (being sick), redness of the skin, itching and rash

706

707 Other side effects that may occur have been listed by frequency:

Uncommon side effects (may affect up to 1 in 100 people)	<ul style="list-style-type: none">• allergic reactions
Rare side effects (may affect up to 1 in 1,000 people)	<ul style="list-style-type: none">• unusual taste in the mouth• hives, increased perspiration
Very rare side effects (may affect up to 1 in 10,000 people)	<ul style="list-style-type: none">• agitation, anxiety• coma, seizures, syncope (brief loss of consciousness), faintness (dizziness and feeling of imminent loss of consciousness), dizziness, disorder of smell (perception of often unpleasant odours), tremor• conjunctivitis, red eye, blurred vision, increased tear secretion, eye swelling• cardiac arrest, accelerated or slow heart beat, irregular heart beat, palpitations, low or high blood pressure, vascular dilatation, pallor• respiratory arrest, pulmonary oedema, breathing difficulties, feeling of tight throat, wheezing, stuffy nose, sneezing, cough, dry throat• diarrhoea, stomach pain, increased saliva secretion• eczema• muscle contractures, muscle weakness, back pain• malaise, chest pain, chest discomfort, fever, chills, swelling of the face, fatigue, injection site discomfort, injection site reaction, injection site swelling, diffusion of the product outside of blood vessels that can lead to inflammation (redness and local pain) or tissue dying off at the injection site, inflammation of a vein• decrease in oxygen level in blood

708

709

710 There have been reports of nephrogenic systemic fibrosis (which causes hardening of the skin and may
711 affect also soft tissue and internal organs), most of which were in patients who received {X} together with
712 other gadolinium-containing contrast agents. If, during the weeks following the MRI examination, you
713 notice changes in the colour and/or thickness of your skin in any part of your body, inform the radiologist
714 who performed the examination.

715

716 After the administration, you will be kept under observation for at least half an hour. Most side effects
717 occur immediately or sometimes delayed. Some effects can occur up to seven days after {X} injection.

718 There is a small risk that you may have an allergic reaction to {X}. Such reactions can be severe and result
719 in shock (case of allergic reaction that could put your life in danger). The following symptoms may be the

720 first signs of a shock. Inform immediately your doctor, radiologist or health professional if you feel any of
721 them:

- 722 • swelling of the face, mouth or throat which may cause you difficulties in swallowing or breathing
- 723 • swelling of hands or feet
- 724 • lightheadedness (hypotension)
- 725 • breathing difficulties
- 726 • whistling respiration
- 727 • coughing
- 728 • itching
- 729 • runny nose
- 730 • sneezing
- 731 • eye irritation
- 732 • hives
- 733 • skin rash

734 If any of the side effects get serious, or if you notice any side effects not listed in this leaflet, please tell
735 your doctor or pharmacist.

736

737 **Reporting of side effects**

738 If you get any side effects, talk to your <doctor> <or> <,> <pharmacist> <or nurse>. This includes any
739 possible side effects not listed in this leaflet. You can also report side effects directly via **the national**
740 **reporting system listed in [Appendix V](#)**.^{*} By reporting side effects you can help provide more information
741 on the safety of this medicine.

742

743 [*For the printed material, please refer to the guidance of the annotated QRD template.]

744

745

746 **5. How to store X**

747

748 Keep this medicine out of the sight and reach of children.

749

750 Do not use this medicine after the expiry date that is stated on the label<carton> <bottle> <...> <after
751 {abbreviation used for expiry date}>. The expiry date refers to the last day of that month.

752

753 Keep the <vial><bottle> in the outer carton in order to protect from light.

754

755 This medicinal product does not require any special precaution for storage.

756

757 Chemical and physical in-use stability has been demonstrated [...] hours at [...]°C. From a
758 microbiological point of view, the product should be used immediately. If not used immediately, in-use
759 storage times and conditions prior to use are the responsibility of the user and would normally not be
760 longer than [...] hours at 2°C to 8°C.

761

762 This medicine should not be used if any visible signs of deterioration (such as particles in the solution or
763 fissures in the vial) are noticed.

764

765 <Do not throw away any medicines via wastewater <or household waste>. Ask your pharmacist how to
766 dispose of medicines no longer required. These measures will help to protect the environment.

767

768

769 **6. Contents of the pack and other information**

770

771 **What {X} contains**

772 The active substance is gadoteric acid.

773

774 One millilitre of solution for injection contains 279.32 mg of gadoteric acid (as meglumine salt),
775 equivalent to 0.5 mmol of gadoteric acid (as meglumine salt).

776
777 The other ingredients are [*product specific*]

778
779 **What {X} looks like and contents of the pack**

780
781 Solution for injection.

782
783 Clear colourless to yellow solution.

784
785 [*Nature and contents of the container - product specific*]

786
787 {X} is presented in the following packs:

788
789 [*Product specific*]

790
791 Not all pack sizes may be marketed.

792
793 **Marketing Authorisation Holder and Manufacturer**

794 {Name and address}

799 **This leaflet was last revised in** <{MM/YYYY}><{month YYYY}>.

800
801 **Other sources of information**

802
803 Detailed information on this medicine is available on the European Medicines Agency web site:
804 <http://www.ema.europa.eu><, and on the website of {name of MS Agency (link)}>. <There are also links to
805 other websites about rare diseases and treatments.>

806
807 This leaflet is available in all EU/EEA languages on the European Medicines Agency website.

808
809 <----->

810
811 **The following information is intended for medical or healthcare professionals only:**

812
813 **Posology**

814 The recommended dose for intravenous injection in adults is 0.2 mL/kg body weight (BW) (equivalent to
815 0.1 mmol/kg BW) to provide diagnostically adequate contrast.

- 816 - *Encephalic and spinal MRI* In patients with brain tumors, an additional dose of 0.4 mL/kg BW
817 (equivalent to 0.2 mmol/kg BW) may improve tumor characterisation and facilitate therapeutic
818 decision making.
- 819 - *Angiography* In exceptional circumstances (e.g. failure to gain satisfactory images of an extensive
820 vascular territory) administration of a second consecutive injection of 0.2 mL/kg body weight
821 (BW) (equivalent to 0.1 mmol/kg BW) may be justified. However, if the use of 2 consecutive
822 doses of gadoteric acid is anticipated prior to commencing angiography, use of 0.1mL/kg BW
823 (equivalent 0.05 mmol/kg BW) to for each dose may be of benefit, depending on the imaging
824 equipment available.
- 825 - *Children:* The 0.2 mL/kg body weight (BW) (equivalent to 0.1 mmol/kg BW) dose applies to all
826 indications except angiography due to insufficient data on efficacy and safety in this indication.
827 Due to immature renal function in neonates up to 4 weeks of age and infants up to 1 year of age,

828 {X} should only be used in these patients after careful consideration at a dose not exceeding 0.1
829 mmol/kg body weight. More than one dose should not be used during a scan. Because of the lack
830 of information on repeated administration, {X} injections should not be repeated unless the
831 interval between injections is at least 7 days.

832 In neonates and infants the required dose should be administered by hand.

833 - *Patients with renal impairment:* The adult dose applies to patients with mild to moderate renal
834 impairment (GFR \geq 30 mL/min/1.73m²). See also below “Impaired renal function”.

835 - *Patients with hepatic impairment:* The adult dose applies to these patients. Caution is
836 recommended, especially in the case of perioperative liver transplantation period.

837

838 **Method of administration**

839 {X} is indicated for intravenous administration only. {X} must not be administered by subarachnoid (or
840 epidural) injection.

841

842 Infusion rate: 3-5 mL/min (for angiographic procedures, higher infusion rates up to 120 mL/min, i.e. 2
843 mL/sec, may be used for angiographic procedures)

844

845 Optimal imaging: within 45 minutes after injection

846

847 Optimal image sequence: T1-weighted

848

849 Intravascular administration of contrast media should, if possible, be done with the patient lying down.
850 After the administration, the patient should be kept under observation for at least half an hour, since
851 experience shows that the majority of undesirable effects occur within this time.

852

853 For single patient use only, any unused solution should be discarded.

854

855 The solution for injection should be inspected visually prior to use. Only clear solutions free of visible
856 particles should be used.

857

858 **Impaired renal function**

859 Prior to administration of {X}, all patients should be screened for renal dysfunction by obtaining
860 laboratory tests.

861

862 There have been reports of nephrogenic systemic fibrosis (NSF) associated with use of some gadolinium-
863 containing contrast agents in patients with acute or chronic severe renal impairment (GFR <
864 30mL/min/1.73m²). Patients undergoing liver transplantation are at particular risk since the incidence of
865 acute renal failure is high in this group. As there is a possibility that NSF may occur with {X}, it should
866 therefore only be used in patients with severe renal impairment and in patients in the perioperative liver
867 transplantation period after careful risk/benefit assessment and if the diagnostic information is essential
868 and not available with non-contrast enhanced MRI. If it is necessary to use {X}, the dose should not
869 exceed 0.1 mmol/kg body weight. More than one dose should not be used during a scan. Because of the
870 lack of information on repeated administration, {X} injections should not be repeated unless the interval
871 between injections is at least 7 days.

872

873 Haemodialysis shortly after {X} administration may be useful at removing {X} from the body. There is
874 no evidence to support the initiation of haemodialysis for prevention or treatment of NSF in patients not
875 already undergoing haemodialysis.

876

877 **Elderly**

878 As the renal clearance of gadoteric acid may be impaired in the elderly, it is particularly important to
879 screen patients aged 65 years and older for renal dysfunction.

880

881 **Neonates and infants**

882 See under Posology, Children

883

884 **Pregnancy and lactation**

885 {X} should not be used during pregnancy unless the clinical condition of the woman requires use of
886 gadoteric acid.

887

888 Continuing or discontinuing breast feeding for a period of 24 hours after administration of {X} , should be
889 at the discretion of the doctor and lactating mother.

890 **Instructions on handling**

891 The peel-off tracking label on the vials should be stuck onto the patient record to enable accurate recording
892 of the gadolinium contrast agent used. The dose used should also be recorded. If electronic patient records
893 are used, the name of the product, the batch number and the dose should be entered into the patient record.
894
