

Instructions for use - Hexaxim, suspension for injection in pre-filled syringe or vial.

Diphtheria, tetanus, pertussis (acellular, component), hepatitis B (rDNA), poliomyelitis (inactivated) and *Haemophilus influenzae* type b conjugate vaccine (adsorbed).

- Shake the vial so that the contents become homogeneous.
- Hexaxim should not be mixed with other medicinal products.

Hexaxim must be administered intramuscularly. The recommended injection sites are the antero-lateral aspect of the upper thigh in infants and the deltoid muscle in older children.

The intradermal or intravenous routes must not be used. Do not administer by intravascular injection: ensure that the needle does not penetrate a blood vessel.

Medicinal Product no longer authorised
