The Parable of Google Flu: Traps in Big Data Analysis

David Lazer^{1,2,*}, Ryan Kennedy^{1,3,4}, Gary King³, Alessandro Vespignani^{5,6,3}

Apps Launched

- Package under development for other MS by the end of the project

- Considering how utility of the tools might be expanded through APIs

- Evidence based evolution of tools

Value

Patient evaluation

- Patient focused studies to understand barriers and facilitators to the use of the app
- Most value in the news feeds and data streams that we can make available

Scientific Value

- Initial view indicates that the data are equivalent value to traditional data
- Quality & Value under formal evaluation but already contributing to signal detection

Meet patients
where they're at

Protect their
privacy

Give them easy to-
use tools

Social Media

Adverse Events In Social Media

Challenges in detecting events

- Idiomatic expressions, slang, mistakes
- Symptoms vs indications
- Large volume of potentially irrelevant data
- Challenging to code into MedDRA

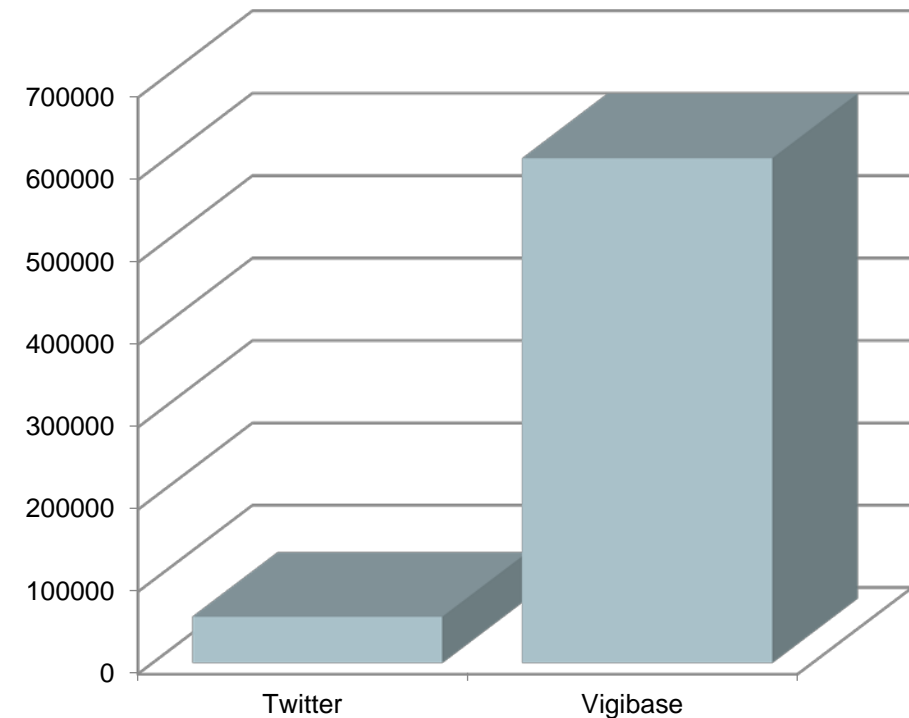

Challenges in signal detection

- Either stand-alone or combine with spontaneous reporting
- If combining – how do we do it?

Comparisons with Vigibase

Step One: How many adverse events in Twitter vs Vigibase

- Data collected: March 2012 -> March 2015
- 38 WEB-RADR generics
- Threshold at “Epidemico score” of 0.7 (Twitter)
- Remember: detected events

Comparisons with Vigibase

Comparisons at the Preferred Term level

- Social Media may be data-rich for specific event types i.e. drug tolerance, dependence, withdrawal syndrome,
- For these specific events it could be the informal nature of social media i.e. not reporting to a physician or official body
- Several potential explanations for the observed differences in the mediums...

Social media conversations on Ritalin over time

October → November – academic work, cold season, contributing to increase mentions

March → April – academic work contributing to increase

Performance Varies Across Drugs

Average Performance Performance in context of specific Drug

Drug	#Training Data	AUC
humira	1481	0.689893
prednisone	1700	0.740568
co-codamol	2294	0.770509
oxycodone	1767	0.770942
meningococcal vaccine	1866	0.811062
essure	2877	0.931683
flu shot	4569	0.943119
hpv vaccine	1668	0.956768
gardasil	2140	0.970276
vaccine	5959	0.973777
tetanus vaccine	3069	0.975138

Where is it useful?

Added value in analysis of:

- Abuse & misuse
- Real world use of medicines

(drugfree.org)

- 'Unexpected benefits'
- Evidence of 'clinical trials' being conducted by users to attain different 'benefits'
- Patterns of abuse both geographically and seasonally
- Patient tolerance and reasons for stopping medication

Where is it useful?

Added value in analysis of:

- Neurological & psychiatric effects
- Pregnancy
- Lifestyle treatments or events

- Large volume of data related to both medicines and events with neuro-psychiatric effects
- Potential for longitudinal analysis of a record; elimination of recall bias over pregnancy?
- Medically less serious events which have a serious impact on the patient and affect compliance

Pregnancy
