Committee for Orphan Medicinal Products

Public summary of opinion on orphan designation

Carglumic acid for the treatment of isovaleric acidaemia

First publication	1 April 2009
Rev.1: information about Marketing Authorisation	24 July 2013
Disclaimer Please note that revisions to the Public Summary of Opinion are purely administrative updates. Therefore, the scientific content of the document reflects the outcome of the Committee for Orphan Medicinal Products (COMP) at the time of designation and is not updated after first publication.	

On 7 November 2008, orphan designation (EU/3/08/575) was granted by the European Commission to Orphan Europe SARL, France, for carglumic acid for the treatment of isovaleric acidaemia.

What is isovaleric acidaemia?

Isovaleric acidaemia is an inherited disease that usually appears in early infancy. It is caused by an abnormal gene. For a patient to develop this disease, he or she needs to have inherited one copy of the abnormal gene from each parent. This is called 'autosomal recessive' transmission. Patients with isovaleric acidaemia produce defective versions of an enzyme called isovaleryl-coenzyme A dehydrogenase, which is normally involved in the breakdown of parts of proteins in the body. When this breakdown process does not happen normally, it results in a build-up of isovaleric acid and the toxic substance ammonia in the blood. This causes symptoms such as poor feeding, vomiting, hypotonia (weak muscle tone causing floppiness), lethargy (lack of energy) and encephalopathy (problems with the brain).

The effects of isovaleric acidaemia are disabling and can be life-threatening.

What is the estimated number of patients affected by the condition?

At the time of designation, isovaleric acidaemia affected approximately 0.01 in 10,000 people in the European Union (EU). This was equivalent to a total of 500 people*, and is below the ceiling for orphan

*Disclaimer: For the purpose of the designation, the number of patients affected by the condition is estimated and assessed on the basis of data from the European Union (EU 27), Norway, Iceland and Liechtenstein. At the time of designation, this represented a population of 502,800,000 (Eurostat 2008).

designation, which is 5 people in 10,000. This is based on the information provided by the sponsor and the knowledge of the Committee for Orphan Medicinal Products (COMP).

What treatments are available?

Current treatments for isovaleric acidaemia aim to remove the ammonia that builds up in the blood. They include sodium benzoate, which is an ammonium scavenger (a substance that mops up ammonia in the blood). Patients can also avoid further build-up of ammonia in the blood by reducing their intake of nitrogen by eating a low-protein diet.

Carglumic acid could be of significant benefit for the treatment of isovaleric acidaemia, because it acts differently from other medicinal products. This assumption will have to be confirmed at the time of marketing authorisation. This will be necessary to maintain the orphan status.

How is this medicine expected to work?

Carglumic acid is very similar in structure to N-acetylglutamate, which activates an enzyme that breaks down ammonia. Carglumic acid therefore helps break down ammonia, reducing ammonia blood levels and its toxic effects. This is expected to relieve the symptoms of isovaleric acidaemia that are caused by high blood ammonia levels.

What is the stage of development of this medicine?

The effects of carglumic acid have not been evaluated in experimental models.

At the time of submission of the application for orphan designation, no clinical trials in patients with isovaleric acidaemia had been initiated.

At the time of submission carglumic acid was not authorised anywhere in the world for isovaleric acidaemia or designated as orphan medicinal product elsewhere for this condition.

In accordance with Regulation (EC) No 141/2000 of 16 December 1999, the COMP adopted a positive opinion on 10 September 2008 recommending the granting of this designation.

Update: carglumic acid (Carbaglu) has been authorised in the EU since 27 May 2011 for treatment of hyperammonaemia due to isovaleric acidaemia.

More information on Carbaglu can be found in the European public assessment report (EPAR) on the Agency's website: ema.europa.eu/Find_medicine/Human_medicines/European_Public_Assessment_Reports

Opinions on orphan medicinal product designations are based on the following three criteria:

- the seriousness of the condition;
- the existence of alternative methods of diagnosis, prevention or treatment;
- either the rarity of the condition (affecting not more than 5 in 10,000 people in the EU) or insufficient returns on investment.

Designated orphan medicinal products are products that are still under investigation and are considered for orphan designation on the basis of potential activity. An orphan designation is not a marketing authorisation. As a consequence, demonstration of quality, safety and efficacy is necessary before a product can be granted a marketing authorisation.
