ANNEX I

SUMMARY OF PRODUCT CHARACTERISTICS
1. NAME OF THE MEDICINAL PRODUCT

Mosquirix powder and suspension for suspension for injection

*Plasmodium falciparum* and hepatitis B vaccine (recombinant, adjuvanted)

2. QUALITATIVE AND QUANTITATIVE COMPOSITION

After reconstitution, 1 dose (0.5 ml) contains 25 micrograms of RTS,S\textsuperscript{1,2} adjuvanted with AS01\textsubscript{E3}.

\textsuperscript{1} Portion of *P. falciparum* circumsporozoite protein fused with hepatitis B surface antigen (RTS), and combined with hepatitis B surface antigen (S)

\textsuperscript{2} in the form of non-infectious virus-like particles (VLPs) produced in yeast cells (*Saccharomyces cerevisiae*) by recombinant DNA technology

\textsuperscript{3} AS01\textsubscript{E} adjuvant is composed of *Quillaja saponaria* Molina, fraction 21 (QS-21) (25 micrograms) and 3-O-desacyl-4’-monophosphoryl lipid A (MPL) (25 micrograms)

For the full list of excipients, see section 6.1.

3. PHARMACEUTICAL FORM

Powder and suspension for suspension for injection.

The powder is white.
The suspension is an opalescent, colourless to pale brownish liquid.

4. CLINICAL PARTICULARS

4.1 Therapeutic indications

Mosquirix is indicated for active immunisation of children aged 6 weeks up to 17 months against malaria caused by *Plasmodium falciparum* and against hepatitis B (see sections 4.2, 4.4 and 5.1).

The use of Mosquirix should be based on official recommendations considering *Plasmodium falciparum* malaria epidemiology in different geographical areas.

4.2 Posology and method of administration

**Posology**

Vaccination in children from 6 weeks up to 17 months of age (at first dose):

- Three doses, each of 0.5 ml, should be given at monthly intervals.
- A fourth dose is recommended 18 months after the third dose.

**Other paediatric population:**

The safety and efficacy of Mosquirix in children younger than 6 weeks and older than 17 months of age (at first dose) have not been established.

**Method of administration**
Mosquirix is for intramuscular injection only.

The anterolateral thigh is the preferred site for injection in children younger than 5 months of age. The deltoid muscle is the preferred site for injection in children aged 5 months and older (see sections 4.4 and 4.5).

For instructions on reconstitution of the medicinal product before administration, see section 6.6.

### 4.3 Contraindications

Hypersensitivity to the active substances or to any of the excipients listed in section 6.1.

Hypersensitivity to a previous dose of Mosquirix or hepatitis B vaccines.

### 4.4 Special warnings and precautions for use

Appropriate medical treatment and supervision should always be readily available in case of an anaphylactic event following the administration of the vaccine.

It is good clinical practice to precede vaccination by a review of the medical history (especially with regard to previous vaccination and possible occurrence of undesirable effects) and a clinical examination.

As with other vaccines, vaccination with Mosquirix should be postponed in subjects suffering from an acute severe febrile illness. The presence of a minor infection, such as a cold, should not result in the deferral of vaccination.

A history of febrile convulsions or a family history of convulsions does not constitute a contraindication for the use of Mosquirix. Vaccinees, especially those with a history of febrile convulsions, should be closely followed up as vaccine related fever may occur after vaccination (see section 4.8). In case of fever, antipyretic measures should be initiated according to local guidelines.

Fever may follow each dose of Mosquirix (see section 4.8). Clinical data generated with other paediatric vaccines suggest that the prophylactic use of paracetamol might reduce the immune response to vaccine antigens. The clinical relevance of this observation remains unknown. In absence of clinical data with Mosquirix, the routine use of prophylactic antipyretic medicinal products before vaccination is therefore not recommended.

**Protection against P. falciparum malaria**

Mosquirix does not provide complete protection against malaria caused by *P. falciparum* (see section 5.1).

Protection against *P. falciparum* malaria wanes over time and vaccination may delay the acquisition of natural immunity (see section 5.1). If symptoms compatible with malaria develop, appropriate diagnosis and treatment should be sought.

Data regarding the efficacy of Mosquirix are limited to children from sub-Saharan Africa.

Mosquirix will not protect against malaria caused by pathogens other than *Plasmodium falciparum*.

The use of other malaria control measures recommended locally should not be interrupted.

**Protection against hepatitis B**

Mosquirix should not be used for the prevention of hepatitis B in settings where prevention against malaria caused by *P. falciparum* is not sought. An immune response against hepatitis B may not be elicited in all vaccinees (see section 5.1). Mosquirix will not protect against hepatitis caused by other pathogens other than hepatitis B virus.
Meningitis

In clinical studies, meningitis (any aetiology) has been reported more frequently in the group vaccinated with three doses of Mosquirix up to 20 months post dose 1 (27 cases out of 11,439 vaccinees) compared with the control group (4 cases out of 6,096 vaccinees). A causal relationship to the vaccine has not been established.

Systemic immunosuppressive medications and immunodeficiency

There are no data in children receiving immunosuppressive treatment or children with immunodeficiencies other than HIV infection. In these children, it cannot be ruled out that efficacy is impaired. Limited data are available with HIV-infected children (see sections 4.8 and 5.1).

Precautions for use

Do not administer the vaccine intravascularly, intradermally or subcutaneously.

Patients at risk of bleeding

As with other vaccines administered intramuscularly, Mosquirix should be given with caution to individuals with thrombocytopenia or any coagulation disorder since bleeding may occur following an intramuscular administration to these subjects.

Preterm infants

The potential risk of apnoea and the need for respiratory monitoring for 48 to 72 h should be considered when administering the first three doses to very preterm infants (born ≤ 28 weeks of gestation) who remain hospitalised at the time of vaccination and particularly for those with a previous history of respiratory immaturity.

Sodium and Potassium content

This vaccine contains potassium, less than 1 mmol (39 mg) per dose, i.e. essentially ‘potassium-free’.

This vaccine contains less than 1 mmol sodium (23 mg) per dose, that is to say essentially ‘sodium-free’.

Traceability

In order to improve the traceability of biological medicinal products, the name and the batch number of the administered product should be clearly recorded.

4.5 Interaction with other medicinal products and other forms of interaction

Use with other vaccines

If Mosquirix is to be given at the same time as another injectable vaccine, the vaccines should always be administered at different injection sites.

Mosquirix can be given concomitantly with any of the following monovalent or combination vaccines including diphtheria (D), tetanus (T), whole cell pertussis (Pw), acellular pertussis (Pa), hepatitis B (HepB), Haemophilus influenzae type b (Hib), oral polio (OPV), measles, rubella, yellow fever, rotavirus and pneumococcal conjugate vaccines (PCV). The co-administration of Mosquirix with PCV increases the risk of fever within 7 days post-vaccination (see section 4.8).

Concomitant administration of rotavirus and pneumococcal conjugate vaccines with Mosquirix may reduce the antibody response to the circumsporozoite (CS) antigen of Mosquirix. The impact of this observation on the level of protection induced by Mosquirix is currently unknown.

Use with systemic immunosuppressive medications
In the absence of data it cannot be ruled out that efficacy is impaired in children receiving immunosuppressive treatment.

*Use with prophylactic administration of antipyretics*

See section 4.4.

4.6 *Fertility, pregnancy and lactation*

There are no or limited amount of data from the use of Mosquirix in pregnant women. No animal studies were performed with Mosquirix with respect to reproductive toxicity.

Mosquirix is not intended for use in women of childbearing potential.

4.7 *Effects on ability to drive and use machines*

Not relevant.

4.8 *Undesirable effects*

**Summary of the safety profile**

In clinical studies, the most serious adverse reaction associated with Mosquirix was febrile seizures (within 7 days post-vaccination) (0.1%). The most commonly reported adverse reactions were fever (27%), irritability (14%) and injection site reactions such as pain (16%) and swelling (7%).

**Tabulated list of adverse reactions**

**Adverse reactions after 3 doses**

The safety profile presented below is based on a pooled analysis of more than 11,000 children who have been vaccinated in clinical studies with 3 doses of Mosquirix.

Adverse reactions reported are listed according to the following frequency:

- **Very common** \(\geq 1/10\)
- **Common** \(\geq 1/100 \text{ to } < 1/10\)
- **Uncommon** \(\geq 1/1000 \text{ to } < 1/100\)

**Table 1:** Adverse reactions reported after 3 doses of the vaccine

</table>

**Other special populations**

**HIV-infected children**

Data from clinical studies suggest that HIV-infected children are more likely to experience local and systemic reactivity (injection site pain and injection site erythema, fever, somnolence, irritability, decreased appetite) compared to children of unknown HIV infection status.

**Description of selected adverse reactions**

**Fever**

In a clinical study in infants aged 8-12 weeks, fever was reported more frequently in infants receiving PCV in co-administration with Mosquirix, DTPa/Hib and OPV simultaneously (26%), as compared to infants receiving only Mosquirix, DTPa/Hib and OPV (14%). The frequency of grade 3 fever on co-administration (defined as axillary temperature > 39.0°C) was ≤ 1%.

**Adverse reactions after the 4th dose**

Clinical data in more than 4200 children who received a fourth dose of Mosquirix shows that, following this dose, decreased appetite was reported more frequently (very common) compared to the rates observed after the first three doses. All other adverse reactions occurred at the same or lower frequency as reported in Table 1.

**Reporting of suspected adverse reactions**

Reporting suspected adverse reactions after authorisation of the medicinal product is important. It allows continued monitoring of the benefit/risk balance of the medicinal product. Healthcare professionals are asked to report any suspected adverse reactions.

**4.9 Overdose**

No case of overdose has been reported. In the event of overdose, monitoring of vital functions and possible symptomatic treatment is recommended.
5. PHARMACOLOGICAL PROPERTIES

5.1 Pharmacodynamic properties

Pharmacotherapeutic group: not yet assigned, ATC code: not yet assigned

Mechanism of action

Mosquirix is a pre-erythrocytic vaccine intended to limit the ability of *Plasmodium falciparum* to infect, mature and multiply in the liver by eliciting humoral and cellular immunity to the circumsporozoite (CS) protein, which is abundantly present at the surface of the sporozoite.

Mosquirix induces antibodies against hepatitis B surface antigen (anti-HBs antibodies).

**Vaccine efficacy**

In a Phase III randomized controlled double-blind study conducted at 11 centres in 7 sub-Saharan African countries with a wide range of transmission intensities, more than 15,000 children from two age groups (6-12 weeks and 5-17 months) were enrolled to evaluate efficacy and safety of Mosquirix when given according to a 0, 1, 2-month schedule. In addition, more than 4200 children (including children from both age groups) received a fourth dose, given 18 months after the third dose.

Children from the 6-12 weeks age group received Mosquirix concomitantly with DTPw-HepB+Hib and OPV vaccines.

The primary objective of the study was efficacy against first or only episode of clinical malaria over a follow-up period of 12 months after three doses in each age group.

The secondary objectives included efficacy against all episodes of clinical malaria, efficacy against severe malaria and efficacy against hospitalisation caused by malaria over different follow-up periods after three doses in each age group.

The efficacy of Mosquirix was evaluated in the context of high insecticide treated bed nets coverage (86% in the 6-12 weeks age group and 78% in the 5-17 months age group).

**Infants aged 6-12 weeks (at first dose)**

In infants aged 6-12 weeks, the vaccine efficacy (VE) against first or only episode of clinical malaria over 12 months of follow-up (co-primary objective) was 31% (97.5% CI: 24; 38).

A summary of the secondary objectives pertaining to VE over different follow-up periods, in infants who received three doses only or three doses plus a fourth dose, is given in Table 2.

** The follow-up period from dose 3 to study end was not the same for all subjects because the study ended on a fixed date. The median length for this follow-up period is 36 months.

Children aged 5-17 months (at first dose)

In children aged 5-17 months, the VE against first or only episode of clinical malaria over 12 months of follow-up (co-primary objective) was 56% (97.5% CI: 51; 60).

A summary of the secondary objectives pertaining to VE over different follow-up periods, in children who received three doses only or three doses plus a fourth dose, is given in Table 3.

**Vaccine-induced immunogenicity**

No correlate of protection has currently been established.

*Immunogenicity against the circumsporozoite (CS) protein*

In the Phase III efficacy study, the geometric mean concentration (GMC) of antibodies against the circumsporozoite (CS) protein, was measured after the third dose of Mosquirix (month 3) as well as before and after the fourth dose (months 20 and 21) in a subset within each age group.

Antibody responses for each age group are given in Table 5.

N= total number of children/infants immunised according to schedule (ATP cohort) with available results

**Immunogenicity against hepatitis B**

The immunogenicity of Mosquirix following three doses has been evaluated in infants aged 8-12 weeks (at first dose). One month post-vaccination in the ATP cohort, 100% of the infants were seroprotected for hepatitis B (N=141). These infants did not receive any other hepatitis B antigen-containing vaccine.

**Immunogenicity in special sub-populations**

**HIV infected children**

In the Phase III efficacy study, children were not screened for HIV infection at enrolment.

Based on clinical data on 125 children with a confirmed HIV infection, Mosquirix elicited a lower anti-CS antibody response in HIV-infected children (GMC=193 EU/ml) as compared with children of unknown HIV infection status (GMC=492 EU/ml), one month after the third dose of Mosquirix.

In another clinical study, children with HIV infection stages 1 or 2, in the context of high treatment (anti-retrovirals and co-trimoxazole) coverage, were vaccinated with 3 doses of Mosquirix (N=99) or rabies vaccine (N=101). The anti-CS antibody GMC was 329 EU/mL one month after the third dose. Over 12 months of follow-up after the third dose of Mosquirix, VE against all episodes of clinical malaria was 37% (95% CI: -27; 69).

**Preterm infants**

The immunogenicity of Mosquirix in 362 preterm infants born after a gestation period of less than 37 weeks (median 36 weeks, with a range of 27 to 36 weeks), was evaluated one month after the third dose. The vaccine induced a similar anti-CS response in preterm infants (GMC=262 EU/ml) as compared to infants born after at least 37 weeks of gestation (GMC=247 EU/ml).

**Low weight-for-age (malnourished) children**

The immune response to CS protein was comparable for normal, low and very low weight-for-age children. The efficacy of Mosquirix is not expected to vary substantially according to weight-for-age.

### 5.2 Pharmacokinetic properties

Not applicable.
5.3 Preclinical safety data

Non-clinical data reveal no special hazard for humans based on conventional studies of safety pharmacology, repeated dose toxicity, genotoxicity and local tolerance.

6. PHARMACEUTICAL PARTICULARS

6.1 List of excipients

**Powder:**
Sucrose, polysorbate 80, disodium phosphate dihydrate, sodium dihydrogen phosphate dihydrate.

**Suspension:**
Dioleoyl phosphatidylcholine (DOPC), cholesterol, sodium chloride, disodium phosphate anhydrous, potassium dihydrogen phosphate, water for injections

6.2 Incompatibilities

This medicinal product must not be mixed with other medicinal products.

6.3 Shelf life

3 years

**After reconstitution:**

Chemical and physical in-use stability has been demonstrated for 6 hours at 25°C.

From a microbiological point of view, the product should be used immediately. If not used immediately, in-use storage times and conditions prior to use are the responsibility of the user and would normally not be longer than 6 hours at 2°C to 8°C.

6.4 Special precautions for storage

Store in a refrigerator (2°C – 8°C).
Do not freeze.
Store in the original package in order to protect from light.

For storage conditions after reconstitution of the medicinal product, see section 6.3.

6.5 Nature and contents of container

- Powder for 2 doses in a vial (type I glass) with a stopper (bromobutyl rubber), aluminium seal with a flip-off polypropylene cap;
- 1 ml suspension for 2 doses in a vial (type I glass) with a stopper (chlorobutyl rubber), aluminium seal with a flip-off polypropylene cap.

Mosquirix is available in a pack size of 50 vials of powder plus 50 vials of suspension.

6.6 Special precautions for disposal and other handling

The powder and suspension should be inspected visually for any foreign particulate matter and/or variation of appearance. If either is observed, do not administer the vaccine.

Mosquirix must be reconstituted prior to administration.
1. Withdraw the entire contents of the vial containing the suspension into the syringe.

2. Add the entire contents of the syringe into the vial containing the powder.

3. Shake gently until the powder is completely dissolved.

The reconstituted vaccine is an opalescent, colourless to pale brownish liquid.

The reconstituted vaccine should be inspected visually for any foreign particulate matter and/or variation of appearance. If either is observed, do not administer the vaccine.

After reconstitution, the vaccine should be used immediately; if this is not possible, the vaccine should be stored in a refrigerator (2°C – 8°C). If not used within 6 hours it should not be administered.

Each dose of 0.5 ml should be withdrawn using a sterile needle and syringe; precautions should be taken to avoid contamination of the contents.

A new needle should be used to administer each individual dose of the vaccine.

Any unused medicinal product or waste material should be disposed of in accordance with local requirements.

Belgium

Name and address of the manufacturer(s) responsible for batch release
GlaxoSmithKline Biologicals S.A.
Rue de l'institut 89
1330 Rixensart
Belgium

B. Conditions or Restrictions Regarding Supply and Use

Medicinal product subject to medical prescription.

- Official batch release

The CHMP recommends that batch compliance control of individual batches be performed before release on the market in third countries.

C. Other Conditions and Requirements of the Scientific Opinion

- Periodic safety update reports (PSURs)

The scientific opinion holder shall submit the first PSUR for this product within 90 calendar days after the data lock point of 04/03/2016. Subsequently, the scientific opinion holder shall submit PSURs for this product every year until otherwise agreed by the CHMP.

D. Conditions or Restrictions with Regard to the Safe and Effective Use of the Medicinal Product

- Risk management plan (RMP)

The scientific opinion holder shall perform the required pharmacovigilance activities and interventions detailed in the agreed RMP presented in Module 1.8.2 of the scientific opinion application and any agreed subsequent updates of the RMP.

An updated RMP should be submitted:
- At the request of the European Medicines Agency;
- Whenever the risk management system is modified, especially as the result of new information being received that may lead to a significant change to the benefit/risk profile or as the result of an important (pharmacovigilance or risk minimisation) milestone being reached.
ANNEX III

LABELLING AND PACKAGE LEAFLET
A. LABELLING
**PARTICULARS TO APPEAR ON THE OUTER PACKAGING**

1. **NAME OF THE MEDICINAL PRODUCT**

Mosquirix powder and suspension for suspension for injection
*Plasmodium falciparum* and hepatitis B vaccine (recombinant, adjuvanted)

2. **STATEMENT OF ACTIVE SUBSTANCE(S)**

After reconstitution, 1 dose (0.5 ml) contains 25 micrograms of RTS,S\(^1,2\) adjuvanted with AS01\(_E\)^3.

\(^1\) Portion of *P. falciparum* circumsporozoite protein fused with hepatitis B surface antigen (RTS), and combined with hepatitis B surface antigen (S)

\(^2\) in the form of non-infectious virus-like particles (VLPs) produced in yeast cells (*Saccharomyces cerevisiae*) by recombinant DNA technology

\(^3\) AS01\(_E\) adjuvant is composed of *Quillaja saponaria* Molina, fraction 21 (QS-21) (25 micrograms) and 3-O-desacyl-4’- monophosphoryl lipid A (MPL) (25 micrograms)

3. **LIST OF EXCIPIENTS**

**Powder:**
Sucrose, polysorbate 80, disodium phosphate dihydrate, sodium dihydrogen phosphate dihydrate.

**Suspension:**
Dioleoyl phosphatidylecholine (DOPC), cholesterol, sodium chloride, disodium phosphate anhydrous, potassium dihydrogen phosphate, water for injections

4. **PHARMACEUTICAL FORM AND CONTENTS**

Powder and suspension for suspension for injection

50 vials: powder (antigen)
50 vials: suspension (adjuvant)

50 x 2 doses (1 ml)

5. **METHOD AND ROUTE(S) OF ADMINISTRATION**

Read the package leaflet before use.
Intramuscular use

6. **SPECIAL WARNING THAT THE MEDICINAL PRODUCT MUST BE STORED OUT OF THE SIGHT AND REACH OF CHILDREN**

Keep out of the sight and reach of children.
### 7. OTHER SPECIAL WARNING(S), IF NECESSARY

Powder and suspension to be reconstituted before administration.

### 8. EXPIRY DATE

**EXP**: MM/YYYY

### 9. SPECIAL STORAGE CONDITIONS

Store in a refrigerator (2°C – 8°C).
Do not freeze.
Store in the original package in order to protect from light.

### 10. SPECIAL PRECAUTIONS FOR DISPOSAL OF UNUSED MEDICINAL PRODUCTS OR WASTE MATERIALS DERIVED FROM SUCH MEDICINAL PRODUCTS, IF APPROPRIATE

Dispose of in accordance with local regulations.

### 11. NAME AND ADDRESS OF THE SCIENTIFIC OPINION HOLDER

B. PACKAGE LEAFLET
Mosquirix

Plasmodium falciparum and hepatitis B vaccine (recombinant, adjuvanted)

Read all of this leaflet carefully before your child starts receiving this vaccine because it contains important information for you.

- Keep this leaflet. You may need to read it again.
- If you have any further questions, ask your doctor or pharmacist.
- This vaccine has been prescribed for your child only. Do not pass it on to others.
- If your child gets any side effects, talk to your doctor or pharmacist. This includes any possible side effects not listed in this leaflet. See section 4.

What is in this leaflet

1. What Mosquirix is and what it is used for
2. What you need to know before your child receives Mosquirix
3. How Mosquirix is given
4. Possible side effects
5. How to store Mosquirix
6. Contents of the pack and other information

1. What Mosquirix is and what it is used for

Mosquirix is a vaccine that helps to protect against malaria caused by the parasite Plasmodium falciparum. Mosquirix also helps to protect your child against the hepatitis B virus, although it should not be used for this purpose only.

Mosquirix can be given to children aged from 6 weeks up to 17 months (at first dose).

Malaria is spread by the bite of an infected mosquito, which passes the malaria parasite into the bloodstream. Malaria is a serious illness with symptoms such as fever, headache, chills and vomiting. If not treated, malaria can progress to severe illness and death.

Hepatitis B is caused by the hepatitis B virus. It causes the liver to become swollen (inflamed). In some people, the virus can stay in the body for a long time, and can eventually lead to serious liver problems, including liver cancer.

How the vaccine works:

- Mosquirix helps your child’s body make its own protection. This will help protect your child against malaria and hepatitis B.

Important information about the protection provided:

- The vaccine does not provide complete protection against malaria caused by P. falciparum so your child might still become sick with malaria. In addition, the protection offered by Mosquirix will decrease after the third and fourth doses. Therefore, it is important that you carry on with all other recommended malaria control measures (see below “Protect your child from malaria”).
- Not all children who are vaccinated with Mosquirix will be protected against hepatitis B infection.
- Mosquirix will only protect against diseases caused by P. falciparum or hepatitis B virus.

Protect your child from malaria:
It is very important that you continue to take precautions to prevent your child from being bitten by mosquitoes:

- Make sure your child sleeps under a bed net treated with insecticide;
- Follow all other precautions as recommended by your doctor or nurse.

**Seek medical care immediately if your child gets malaria symptoms.**

2. **What you need to know before your child receives Mosquirix**

**Mosquirix should not be given**

- If your child is allergic to Mosquirix, hepatitis B vaccines or any of the other ingredients of this vaccine (listed in section 6).

Signs of an allergic reaction may include itchy skin rash, shortness of breath and swelling of the face or tongue.

**Warnings and precautions**

Meningitis (an infection around the brain or spinal cord) has been reported rarely in clinical studies, after vaccination with Mosquirix.

Meningitis symptoms include fever, convulsions, vomiting, irritability, drowsiness, stiff neck, extreme sensitivity to bright light and bulging fontanelle (the soft spot on a baby’s head).

**See a doctor immediately if your child shows symptoms of meningitis.**

Talk to your doctor or pharmacist before your child is given Mosquirix:

- if your child has a tendency to seizures/fits due to a fever, or if there is a history in the family of this. In this case, it is important that you ask your doctor or nurse what to do if your child has fever after being vaccinated with Mosquirix.
- if your child has a severe infection with a high temperature. In these cases, the vaccination may be postponed until recovery. A minor infection such as a cold should not be a problem, but talk to your doctor first.
- if your child has a bleeding problem or bruises easily;
- if your child has breathing difficulties, please contact your doctor. This may be more common in the first three days following vaccination if your child was born prematurely (before or at 28 weeks of pregnancy).

Children with a weakened immune system, for example due to HIV infection or due to medicines that suppress the immune system, may not get the full benefit from Mosquirix.

**Other medicines and Mosquirix**

Tell your doctor if your child is taking, has recently taken or might take any other medicines, or has recently received any other vaccine.

Mosquirix can be given at the same time as other vaccines. A different injection site will be used for each type of vaccine.

**Mosquirix contains Sodium and Potassium**

This vaccine contains potassium, less than 1 mmol (39 mg) per dose, i.e. essentially ‘potassium-free’.
This vaccine contains less than 1 mmol sodium (23 mg) per dose, that is to say essentially ‘sodium-free’.

3. How Mosquirix is given

The doctor or nurse will give the recommended dose of Mosquirix to your child. The first dose can be given from the age of 6 weeks up to 17 months.

Usually, your child will receive three doses of Mosquirix with an interval of one month between doses. After these first three doses, in accordance with local recommendations, your child might receive a fourth dose 18 months after the third dose.

You will be informed when your child should come back for the next dose of Mosquirix.

Mosquirix is given as an injection of 0.5 ml into a muscle.

If your child misses a dose

If your child misses a scheduled dose, make sure he/she finishes the complete vaccination course. This will maximise the protection offered by Mosquirix.

If you have any further questions on the use of this medicine, ask your doctor or pharmacist.

4. Possible side effects

Like all medicines, this vaccine can cause side effects, although not everybody gets them.

Very common (these may occur with more than 1 in 10 doses of the vaccine):
- irritability
- fever
- swelling, redness and pain where the injection was given

Common (these may occur with up to 1 in 10 doses of the vaccine)
- decreased appetite
- drowsiness
- diarrhoea

Uncommon (these may occur with up to 1 in 100 doses of the vaccine):
- convulsions or fits due to fever (within 7 days after vaccination)
- vomiting
- hard lump where the injection was given

Decreased appetite can occur more frequently (very common) after the fourth dose than after the first three doses of Mosquirix. All other adverse reactions occur at the same or lower frequency.

If any of the side effects gets serious, or if you notice any side effects not listed in this leaflet, tell your doctor or pharmacist.

Reporting of side effects

If your child gets any side effects, talk to your doctor or pharmacist. This includes any possible side effects not listed in this leaflet. By reporting side effects you can help provide more information on the safety of this medicine.
5. How to store Mosquirix

Keep this vaccine out of the sight and reach of children.

Do not use this vaccine after the expiry date which is stated on the carton. The expiry date refers to the last day of that month.

Store in a refrigerator (2°C – 8°C).
Store in the original package in order to protect from light.
Do not freeze.

Do not throw away any medicines via wastewater or household waste. Ask your pharmacist how to throw away medicines you no longer use. These measures will help protect the environment.

6. Contents of the pack and other information

What Mosquirix contains

Each vaccine dose contains 25 micrograms of RTS,S with the AS01E adjuvant.

RTS,S contains a small amount of the ‘outer coatings’ of the P. falciparum malaria parasite and of the hepatitis B virus. These ‘outer coatings’ are not infectious and cannot make your child ill.
Adjuvants are used to improve the body’s response to the vaccine.

The other ingredients are:

**Powder**
Sucrose, polysorbate 80, disodium phosphate dihydrate and sodium dihydrogen phosphate dihydrate.

**Suspension**
Dioleoyl phosphatidylcholine, cholesterol, sodium chloride, disodium phosphate anhydrous, potassium dihydrogen phosphate and water for injections.

What Mosquirix looks like and contents of the pack

Powder and suspension for injection.

The powder is white.
The suspension is an opalescent, colourless to pale brownish liquid.

One pack of Mosquirix consists of:

- 50 vials containing powder for 2 doses
- 50 vials containing 1 ml of suspension for 2 doses

Other sources of information
Detailed information on this medicine is available on the European Medicines Agency web site: http://www.ema.europa.eu.

This leaflet is available on the European Medicines Agency website.

The following information is intended for healthcare professionals only:

The powder and suspension should be inspected visually for any foreign particulate matter and/or variation of appearance. If either is observed, do not administer the vaccine.

Mosquirix must be reconstituted prior to administration.

1. Withdraw the entire contents of the vial containing the suspension into the syringe.
2. Add the entire contents of the syringe into the vial containing the powder.
3. Shake gently until the powder is completely dissolved.

The reconstituted vaccine is an opalescent, colourless to pale brownish liquid.

The reconstituted vaccine should be inspected visually for any foreign particulate matter and/or variation of appearance. If either is observed, do not administer the vaccine.

After reconstitution, the vaccine should be used immediately; if this is not possible, the vaccine should be stored in a refrigerator (2°C – 8°C). If not used within 6 hours it should not be administered.

Each dose of 0.5 ml should be withdrawn using a sterile needle and syringe; precautions should be taken to avoid contamination of the contents.

A new needle should be used to administer each individual dose of the vaccine.

Any unused medicinal product or waste material should be disposed of in accordance with local requirement.
