

Workshop on process validation

Closing remarks

Kowid Ho

Process validation biotech drug substance

General concepts

◆ Objective:

- To establish scientific evidence that a process is capable of consistently delivering a quality drug substance.
- Will justify the manufacturing process described in S2.2
- More consistent data submitted and assessed

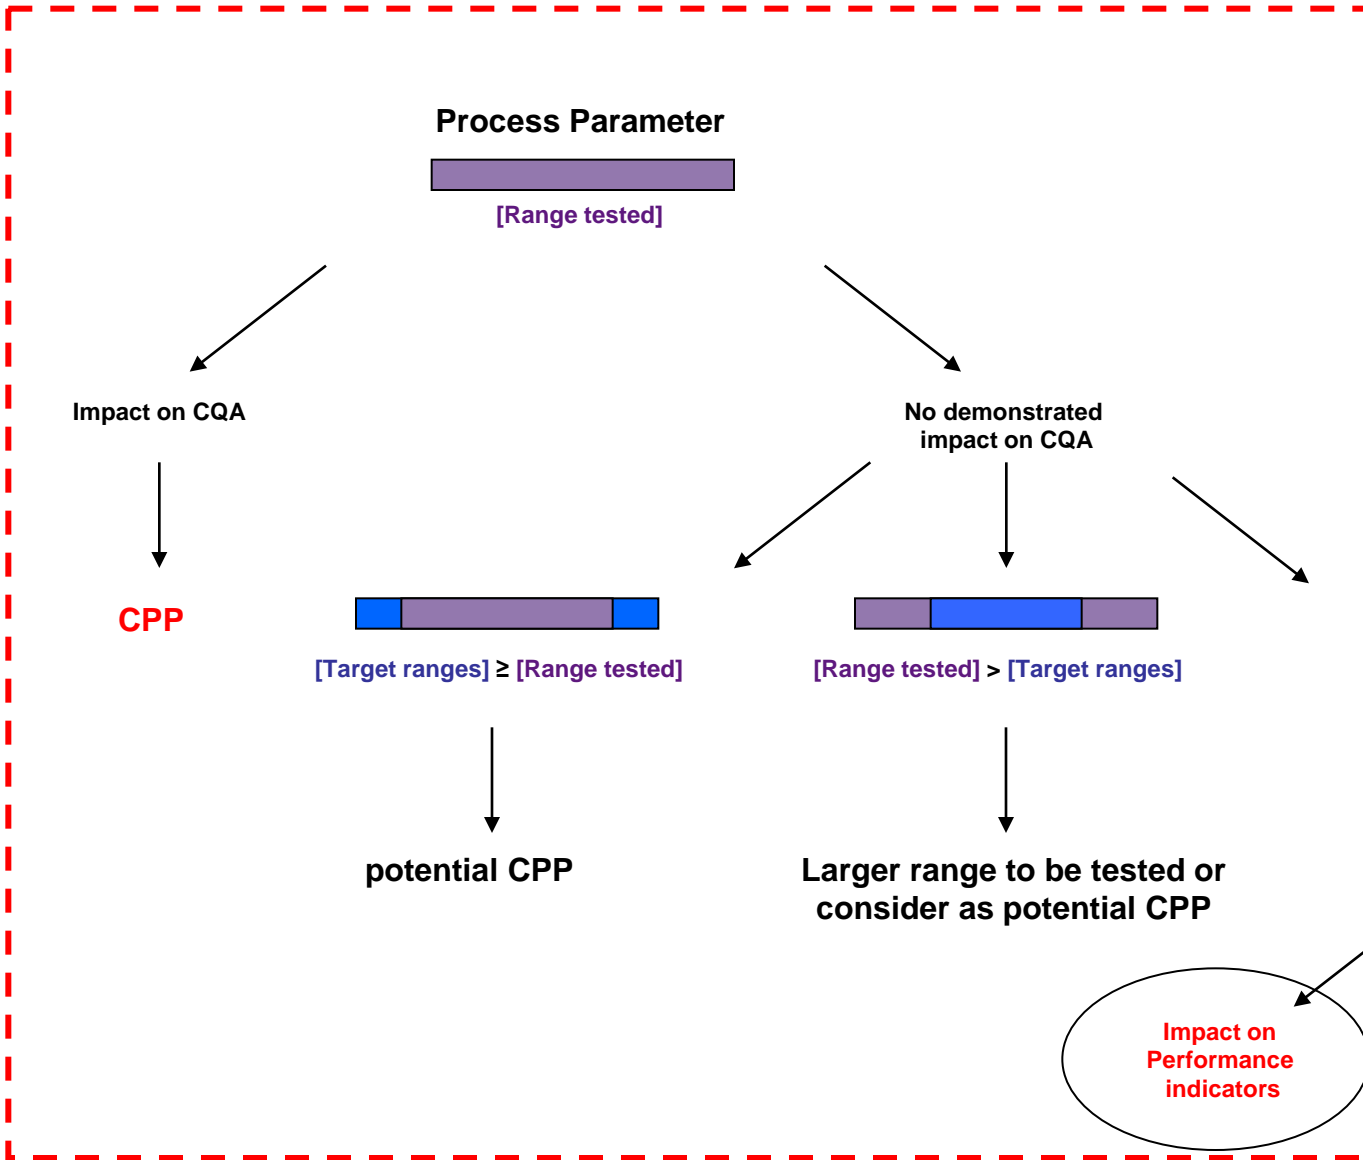

◆ Data expected:

- Process evaluation (small and/or full scale)
- Process verification (full scale) or continuous process verification
- +/- Continued process verification

Process validation biotech drug substance

General concepts

- ◆ Issue with terminology
 - Process
 - ❖ Characterisation: to design intended process
 - ❖ Evaluation: for the process representative of final process
 - ❖ Verification: full scale +/- at target
 - ❖ Continued Verification
 - Process PERFORMANCE indicators/parameters vs CONSISTENCY indicators vs KEY PERFORMANCE indicators
 - ❖ Differentiation between input and output?
 - ❖ Process performance indicators and parameters that don't impact CQA's do not need to be included as regulatory commitments in the MAA?
 - ❖ Point that will require further discussion...

Expected to be included in process validation studies

Process validation biotech drug substance

General concepts

- ◆ Justification of PAR
 - Mainly based from evaluation data?
 - Excursion from PAR: GMP issue?
- ◆ Justification of NOR
 - Mainly based from verification data?

Continued vs Continuous Process Verification

	Continuous Process Verification	Continued (/ongoing?) Process Verification
Aim	- Initial demonstration and/or maintenance of a state of control	- maintenance of a state of control - Lifecycle management
Frequency	- uninterrupted - timely manner	- resumed after interruption - periodic
Testing/Monitoring	- Not limited to CPP and CQA - Include process performance	
Enabler	- PAT tools (MSPC, in-line control...) - Extensive process knowledge and understanding	- GMP compliance - Control strategy during product lifecycle (ex. design space verification)
MAA Submission	- Included in the MAA	- Prospective proposal - May be described in MAA

Process validation biotech drug substance

General concepts

- ◆ Non-CPP measures included:
 - Markers of process consistency
 - Only if non redundant or indicator status?
- ◆ Material and intermediate attributes linked to CQA outcomes
- ◆ Indirect or indicator parameter or attributes demonstrating drift or loss of control
 - Multi-signal/multi-parameter probes
 - Shear forces, gas exchange rates, column-ligand density, non-critical attribute abundance or quality

Upstream

- ◆ Genetic stability of the cell line
 - Done prior to validation
 - Already captured in Q5s

- ◆ Process parameters and quality attributes to be tested
 - Inputs: can be varied; eg Process parameters
 - Outputs
 - ❖ CQA
 - ❖ Performance indicators (cell density, viability)
 - ❖ Consistency indicator ?
 - ❖ “Indicator”: more appropriate for output?
 - Criticality continuum... where to draw the line?
 - ❖ Controlled within narrow range?
 - ❖ For early warning sign?

Upstream

- ◆ Multi-harvest approach
 - Strategy company dependent
 - Need to cover complete harvest
- ◆ Performance indicators for the validation of a continuous perfusion process
 - Indicators and QA not that different from discontinuous fermentation

Upstream & Downstream

- ◆ Qualification of biological raw materials and other raw materials
 - Difficult to incorporate different lots in to validations studies
 - Evaluation to be performed to analyze potential variability
 - Risk based approach
 - “Critical Raw Material” need to be identified?
- ◆ Test frequency
 - Depends on process and product understanding, overall control strategy...
 - Less understood : More testing
 - For non release assay: demonstrated fit for purpose

Upstream & Downstream

- ◆ Single use
 - Risk assessment
 - ❖ impact on performance and QA; eg could be handled as high risk raw material for upstream
 - ❖ attention on extrables/leachables
 - ❖ Quality of the bags (eg sterility of bags) covered by vendor qualification?
 - Same principles for downstream and upstream

Upstream & Downstream

◆ Multifacility

- List of difference + justification
 - ❖ How far can be stretched? Difficult to draw the line
 - ❖ Purpose and outputs still the same?
- Risk assessment on potential impact / comparability exercise
- PV to be done

Upstream & Downstream

◆ Scale Down Models (SDM)

- Incomplete representation but needed !
- Description and justification of inputs, design and outputs
 - ❖ Can explore large ranges
- Outputs:
 - ❖ Product quality attributes > Performance indicators > Other characteristics
 - ❖ SDM should match large scale at target
 - ❖ Statistical approach: difficult to conclude with limited number of full scale batches
- Non-equivalence & offsets
 - ❖ "a question of confidence..."
 - ❖ Depend on the intended use
 - ❖ Ideal should include off-target; doable for downstream? Could be done for upstream?
 - ❖ Could be leverage by proper control strategy / continued PV

Downstream

- ◆ Reprocessing
 - Extraordinary
 - Reprocess step does not impact product quality
 - Root cause clearly identified and does not impact product quality
 - Mainly limited to re-filtration or re-concentration steps
- ◆ Adaptive process and feed back loops
 - No real example of product quality directly measured in the process; future?

Downstream

- ◆ Hold times:
 - Long vs short time storage
 - Often, storage of intermediates is impractical at small scale
 - Cumulative studies of DS bulk:
 - ❖ if stored > weeks; impact on DP stability to be assessed
 - ❖ If stored > months unreasonable, could take years
 - Intermediate hold
 - ❖ Cumulating unlikely; unreasonable?
 - ❖ Program to be included in Continued PV?

Downstream

- ◆ Pooling intermediate
 - Intermediate of specified quality
 - Homogeneity ensured by mixing studies
 - Option to be described in dossier

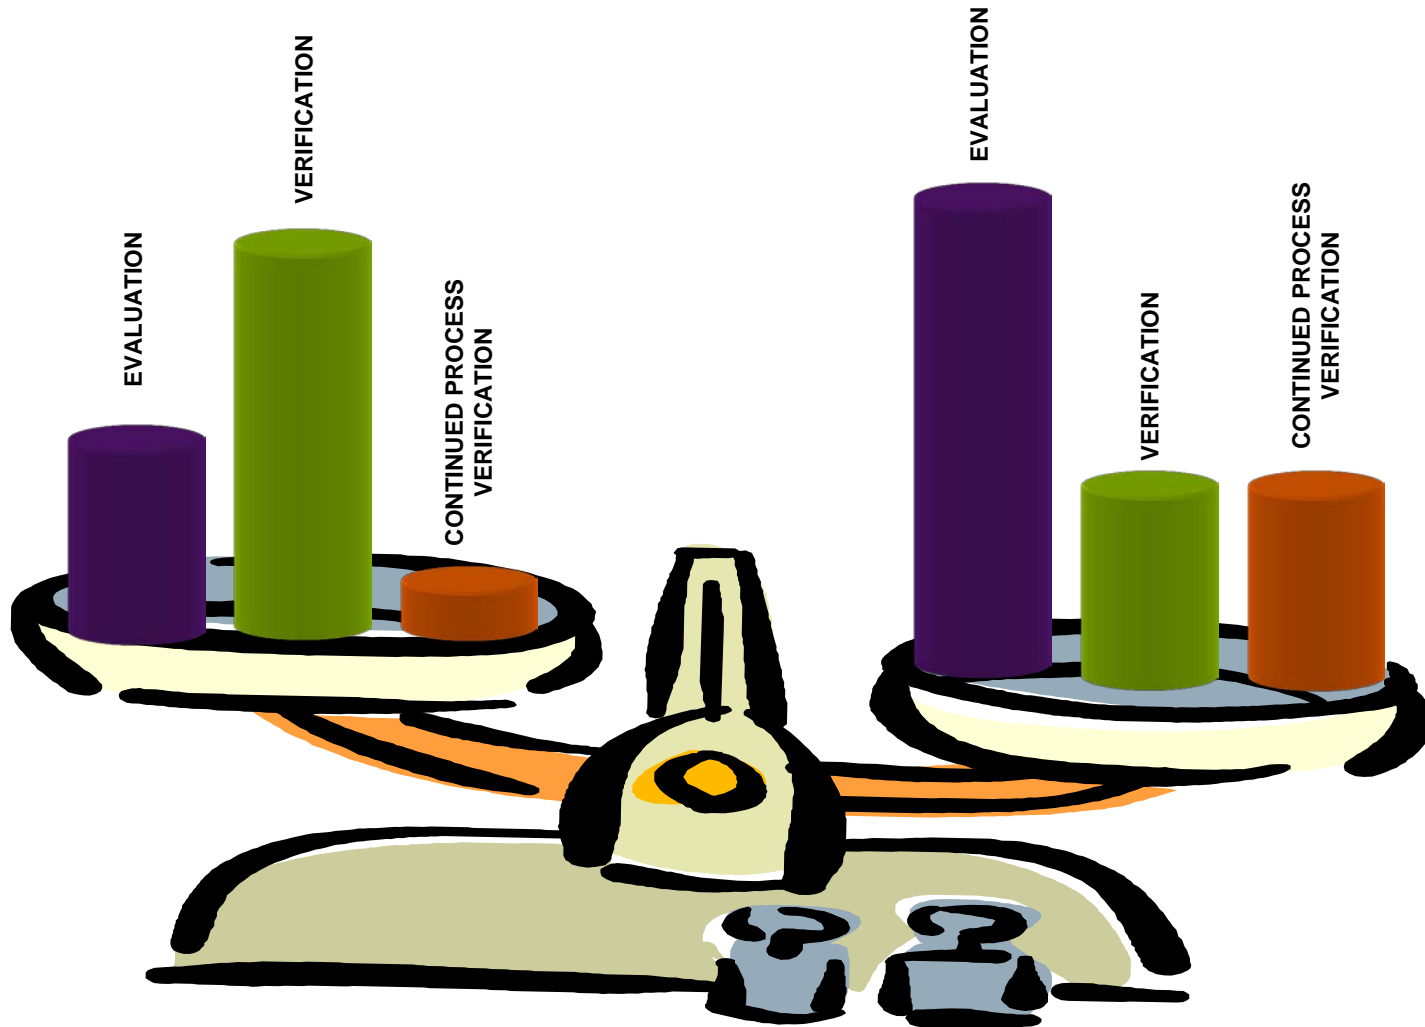

Enhanced/QbD approach

- ◆ Additional studies for enhanced approach
 - Mixture; PV approach likely to be a continuum from tradition to enhanced
 - More integrated approach
 - ❖ including Non-clinical and clinical aspects
 - ❖ Describe and manage influence of CPP on CQA
 - ❖ Control of materials (RM, intermediates...)
 - SDM
- ◆ Flexibility...
 - Considered as an OUTCOME rather than the AIM of enhanced approach for regulators
 - Also depends on data and knowledge shared

Data to be submitted in MAA

TRADITIONAL APPROACH

ENHANCED APPROACH

Closing remark

Continuous discussions...
to be continued...

Thanks you all !!!
