UPPSALA
UNIVERSITET

PK data for supporting PK-PD analyses

Essential PK data

Elisabet Nielsen and Lena Friberg
Pharmacometrics Research Group
Department of Pharmaceutical Biosciences
Uppsala University
Sweden

UPPSALA UNIVERSITET

Outline

- Overview section 4.3 of draft guidelines
  "Clinical pharmacokinetic data to support PK-PD analysis"

- Differences in PK
  - Healthy volunteers vs patients
  - Consequences in terms of PTA

- When is the PK profile important in the PKPD characterization?

UPPSALA UNIVERSITET

Outline

- **Overview section 4.3 of draft guidelines "Clinical pharmacokinetic data to support PK-PD analysis"**

- Differences in PK
  - Healthy volunteers vs patients
  - Consequences in terms of PTA

- When is the PK profile important in the PKPD characterization?

UPPSALA UNIVERSITET

PK Guidelines

- Guideline for **pharmacokinetic studies in man** (EMA/CHMP/EWP/ 3CC3a)
- Guideline on reporting the results of **population pharmacokinetic analyses** (EMEA/CHMP/EWP/185990/2006)
- Guideline on the role of pharmacokinetics in the development of medicinal products in the **paediatric population** (EMEA/CHMP/EWP/147013/2004)
- Guideline on the evaluation of the pharmacokinetics of medicinal products in patients with **impaired hepatic function** (CPMP/EWP/2339/02)
- Note for guidance on the evaluation of the pharmacokinetics of medicinal products in patients with **impaired renal function** (CHMP/EWP/225/02)

UPPSALA UNIVERSITET

4.3.1. PK data from uninfected subjects

Lines 326-331

- Initial PK data from healthy volunteers
- Intensive PK sampling after single and multiple doses
- Describe plasma /serum profiles and routes of metabolism and elimination
- Effects of renal and/or hepatic impairment may need to be assessed
- Initial POPPK model based on healthy subjects
- Used for preliminary dose assessment

UPPSALA UNIVERSITET

4.3.2. PK data from infected patients

Lines 334-352

- PK differences in the infected target patient population
  - renal hyperfiltration
  - altered volume of distribution
  - greater inter-individual variability
  - other covariate relationships
- Intensive PK data in a subset and sparse sampling from total population
- Intended target population
  - site of infection
  - severity of infection
- Update POPPK model
- Sparse sampling of all patients in pivotal clinical efficacy studies

UPPSALA UNIVERSITET

4.3.3. Other relevant data

Lines 354-360

- Degree of binding to plasma proteins for clinically relevant concentrations
- Initially in vitro, spiking human plasma, assess concentration-dependency
- Radiolabelled agent or samples collected during clinical PK studies
- The data collected from infected patients should support a robust estimation of unbound concentrations of the test agent that can be used for PK-PD analyses

UPPSALA UNIVERSITET

Outline

- Overview section 4.3 of draft guidelines
  "Clinical pharmacokinetic data to support PK-PD analysis"

- **Differences in PK**
  - **Healthy volunteers vs patients**
  - **Consequences in terms of PTA**

- When is the PK profile important in the PKPD characterization?

UPPSALA UNIVERSITET

PK in healthy volunteers vs patients

- PK differences due to pathophysiological alterations
  - Indication
  - Severity of illness
  - Range from “healthy” to critically ill patients
  - Intra-individual changes during course of treatment

- Physicochemical properties of the antibiotic

<u>Reviews: PK in the critically ill:</u>

- *Blot SI, et al. Advanced Drug Delivery Reviews. 2014, 77, 3-11*
- *Robets JA, et al. Lancet Infect Dis 2014 14: 498-509*
- *Felton TW et al. Diag Microbiol Infec Dis 79 (2014) 441–447*
- *De Paepe P et al. Clin Pharmacokinet 2002: 41 (14): 1135-1152*

UPPSALA UNIVERSITET

PK in healthy volunteers vs patients

Absorption

- Decreased perfusion of muscles, skin and splanchnic organs
- Lower and less reliable absorption from oral, transdermal, subcutaneous and intramuscular routes
- Few examples in literature
- High variability in absorption related parameters

UPPSALA UNIVERSITET

PK in healthy volunteers vs patients

Distribution

- Vasodilation and increased vascular permeability
- Capillary leak syndrome and fluid shift from intravascular compartment to interstitial space
- Edema and ”third spacing”
- Infusion of fluids to maintain pressure
- Hypoalbuminemia (fu increases)
- Microvascular failure (tissue distribution decreases)

- **Hydrophilic antibiotics**: substantial increase in Vd
  Example aminoglycosides, increase correlated to disease severity
- **Lipophilic antibiotics**: minor influences on Vd
  Example macrolides

UPPSALA UNIVERSITET

PK in healthy volunteers vs patients

Renal elimination

- Glomerular hyperfiltration, fluid resuscitation, vasopressin use
  - Augmented renal CL (>130 ml/1.73m^2)
  - Young men with trauma, sepsis, burns
- Reduced kidney perfusion and acute kidney injury
  - Decreased renal CL, potential need of renal replacement therapy
  - Potential for compensatory elimination (Example ciprofloxacin)
- High inter-individual variability

Hepatic elimination

- Reduced hepatic blood flow, liver failure, hypoproteinemia cholestasis, hepatocellular injury
- Consequences for PK often unclear

UPPSALA UNIVERSITET

Consequences in terms of PTA

Example: Flucloxacillin

Healthy volunteers

- 15 healthy volunteers
- Cross-over study, Heracillin®, p.o. 500 mg and 750 mg
- Frequent PK sampling
- 2 compartment disposition, first-order transit absorption model

Parameter	Estimate	IIV
Clearance, CL/F (L/h)	10.5 (7.1)	25.5 (16)
Inter-compartmental clearance, Q/F (L/h)	0.997 (36)	-
Central volume of distribution, Vc/F (L)	1.78 (17)	-
Peripheral volume of distribution, Vp/F (L)	2.68 (18)	12.5 (68)
Absorption rate constant, ka (h^{-1})	0.859 (7.6)	12.3 (27)
Mean transit time, MTT (h)	0.425 (13)	31.4 (21)
Number of transit compartments, N (-)	2.70 (16)	46.3 (28)
Proportional residual error (%)	24.5 (7.7)	-

Nielsen EI. et al. PAGE: 2012; Venice, Italy

UPPSALA UNIVERSITET

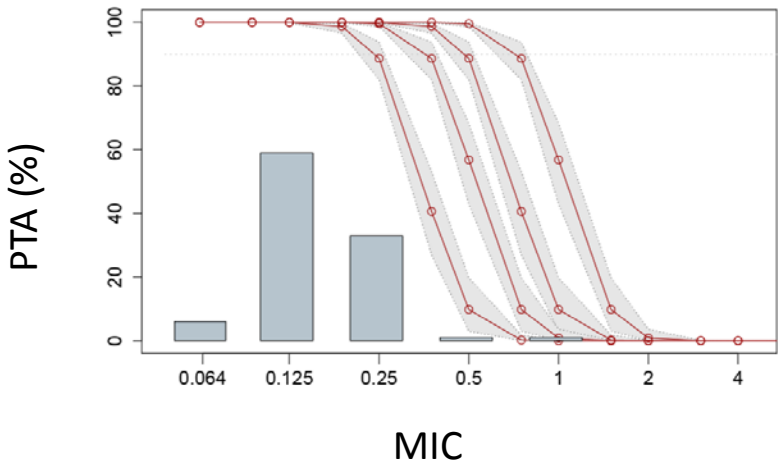
Consequences in terms of PTA

Example: Flucloxacillin

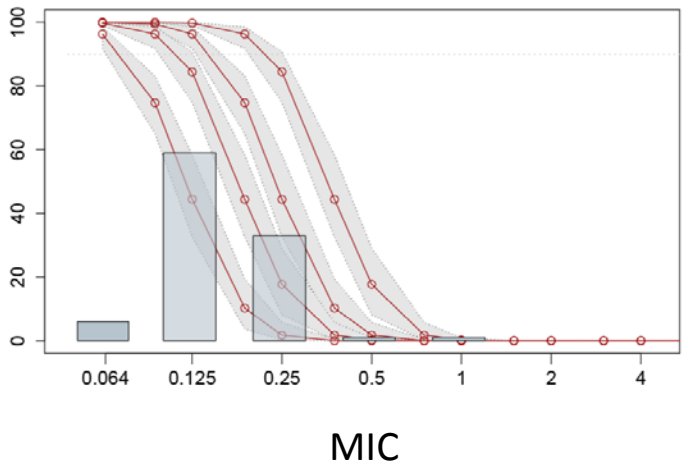
Healthy volunteers

- PTA vs MIC for 500, 750, 1000 and 1500 mg q8h oral flucloxacillin
- Protein binding assumed to be 95% (fu 0.05)
- Parameter uncertainty (non-parametric bootstrap)

PD target: 30% *f*T>MIC



PD target: 50% *f*T>MIC



UPPSALA UNIVERSITET

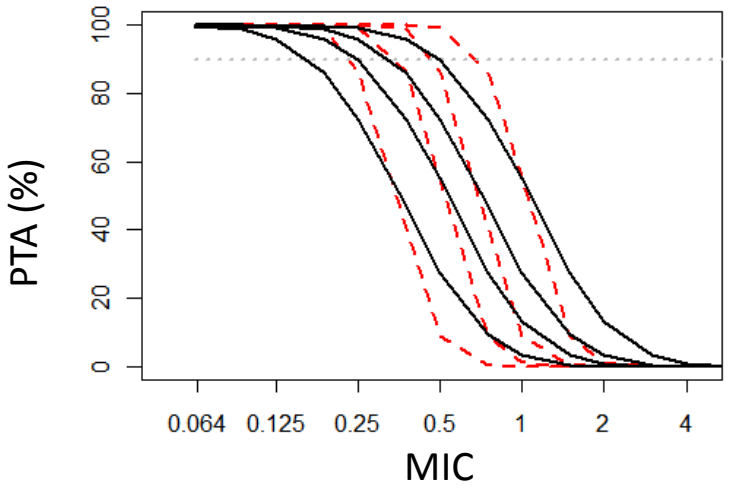
Consequences in terms of PTA

Example: Flucloxacillin

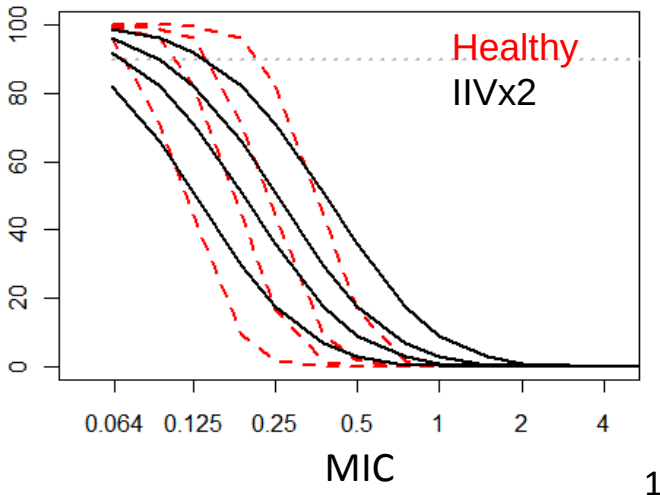
”Healthy” patients

- Increased inter-individual variability in PK parameters (IIVx2)
- Less steep PTA curves
- Lower target attainment in the high, most interesting PTA region

PD target: 30% *f*T>MIC



PD target: 50% *f*T>MIC



UPPSALA UNIVERSITET

Consequences in terms of PTA

Example: Flucloxacillin

Critically ill patients

- 10 critically ill patients with hypoalbuminemia (≤32 g/L)
- Excluded severe renal dysfunction (Pcrea>170 mmol/L)
- MSSA infections nosocomial pneumonia, bacteremia, epidural abscesses, meningitis and surgical site prophylaxis
- Minor changes in CL, increase in V

Table 2. Pharmacokinetic parameters after a maintenance dose for total flucloxacillin in different patient populations; values are given as median (interquartile range) or mean ± SD

	CL (L/h)	CL (L/kg/h)	*V* (L)	*V* (L/kg)	$t_{1/2}$ (h)
Total flucloxacillin (this study, non-compartmental analysis; $n=10$)	9.01 (8.68–17.55)	0.10 (0.10–0.20)	20.00 (12.45–27.20)	0.22 (0.14–0.30)	2.45 (1.26–2.54)
Total flucloxacillin (healthy volunteers; $n=10$)[20]	8.18 ± 0.20	0.12 ± 0.28	9.97 ± 0.17	0.14 ± 0.24	0.84 ± 0.59
Total flucloxacillin (hospitalized patients; $n=7$)[24]	5.53 ± 0.87	0.08 ± 0.01	12.27 ± 2.27	0.18 ± 0.03	1.54 ± 0.35

Ulldemolins et al. J Antimicrob Chemother 2010; 65: 1771–1778

UPPSALA UNIVERSITET

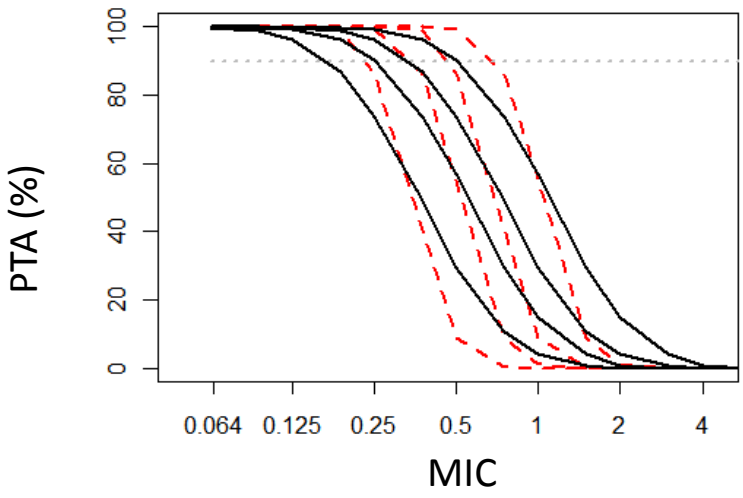
Consequences in terms of PTA

Example: Flucloxacillin

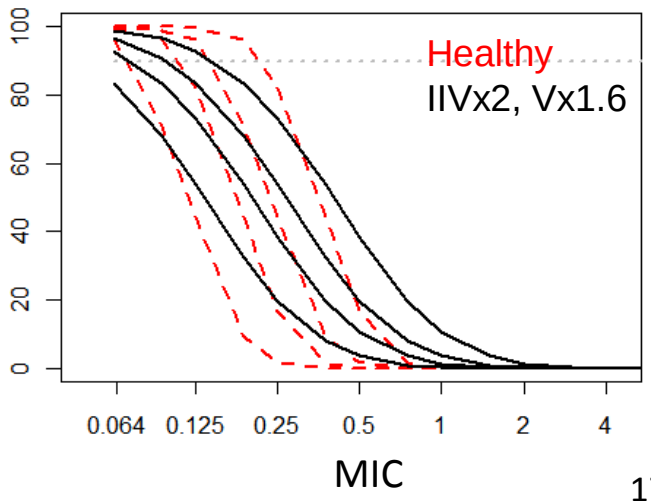
Critically ill patients

- Increased inter-individual variability in PK parameters (IIVx2)
- Increased V (x1.6)
- Increased V -> Only minor alterations in PTA curves

PD target: 30% *f*T>MIC



PD target: 50% *f*T>MIC



UPPSALA UNIVERSITET

Consequences in terms of PTA

Example: Flucloxacillin

Critically ill patients

- Increased inter-individual variability in PK parameters (IIVx2)
- Augmented or reduced CL (CLx2 and CLx0.5)
- Results in PTA shifts

Modelling and simulation to assess population PK (covariates, variability) and explore dosing scenarios

PK importance in PKPD characterization

PK/PD indices

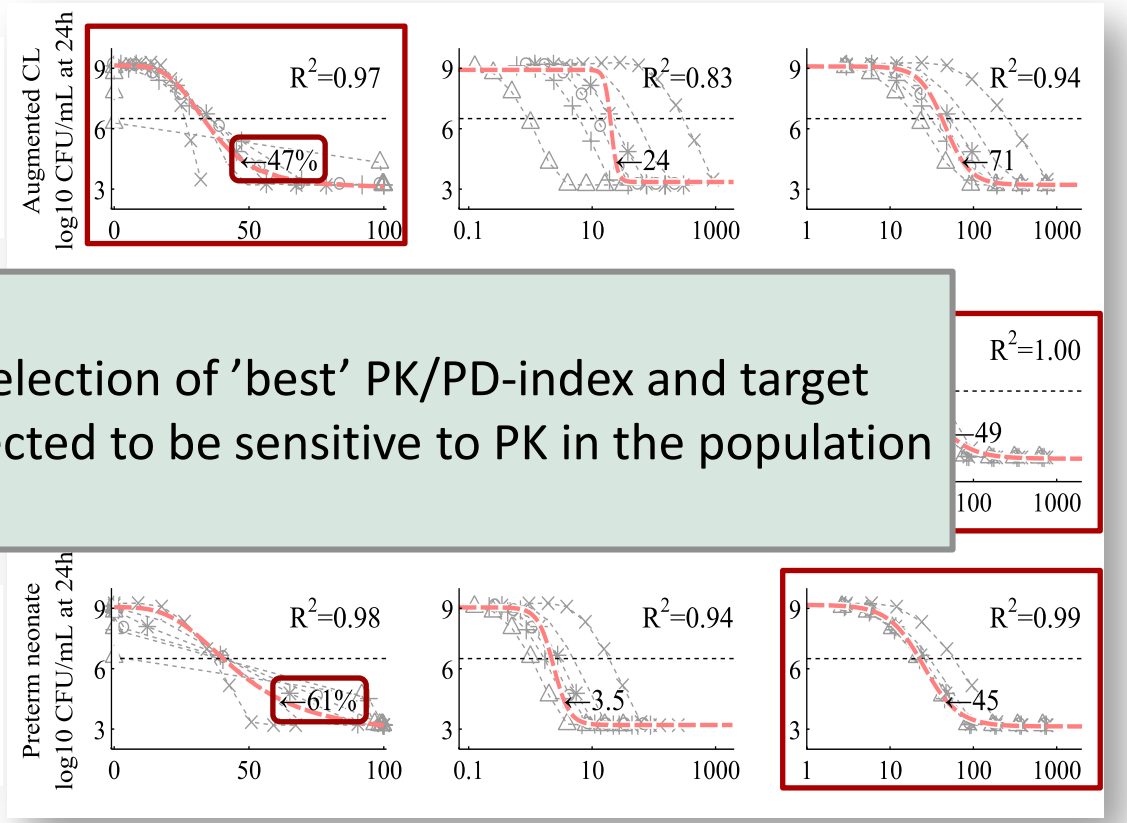
Typical:
Adult, CrCL=83 ml/min
2-comp PK, $t_{1/2,\beta}$ ~ **1.4 h**
(Li *et al*, J Clin Pharmacol 2006)

Renal dysfunction:
Adult, CrCL=15 ml/min
2-comp PK, $t_{1/2,\beta}$ ~ **3.5 h**
(Li *et al*, J Clin Pharmacol 200

Preterm neonate:
GA 31w
2-comp PK, $t_{1/2,\beta}$ ~ **2.5 h**
(van den Anker *et al*, AAC 2009)

Selection of 'best' PK/PD-index and target expected to be sensitive to PK in the population



UPPSALA UNIVERSITET

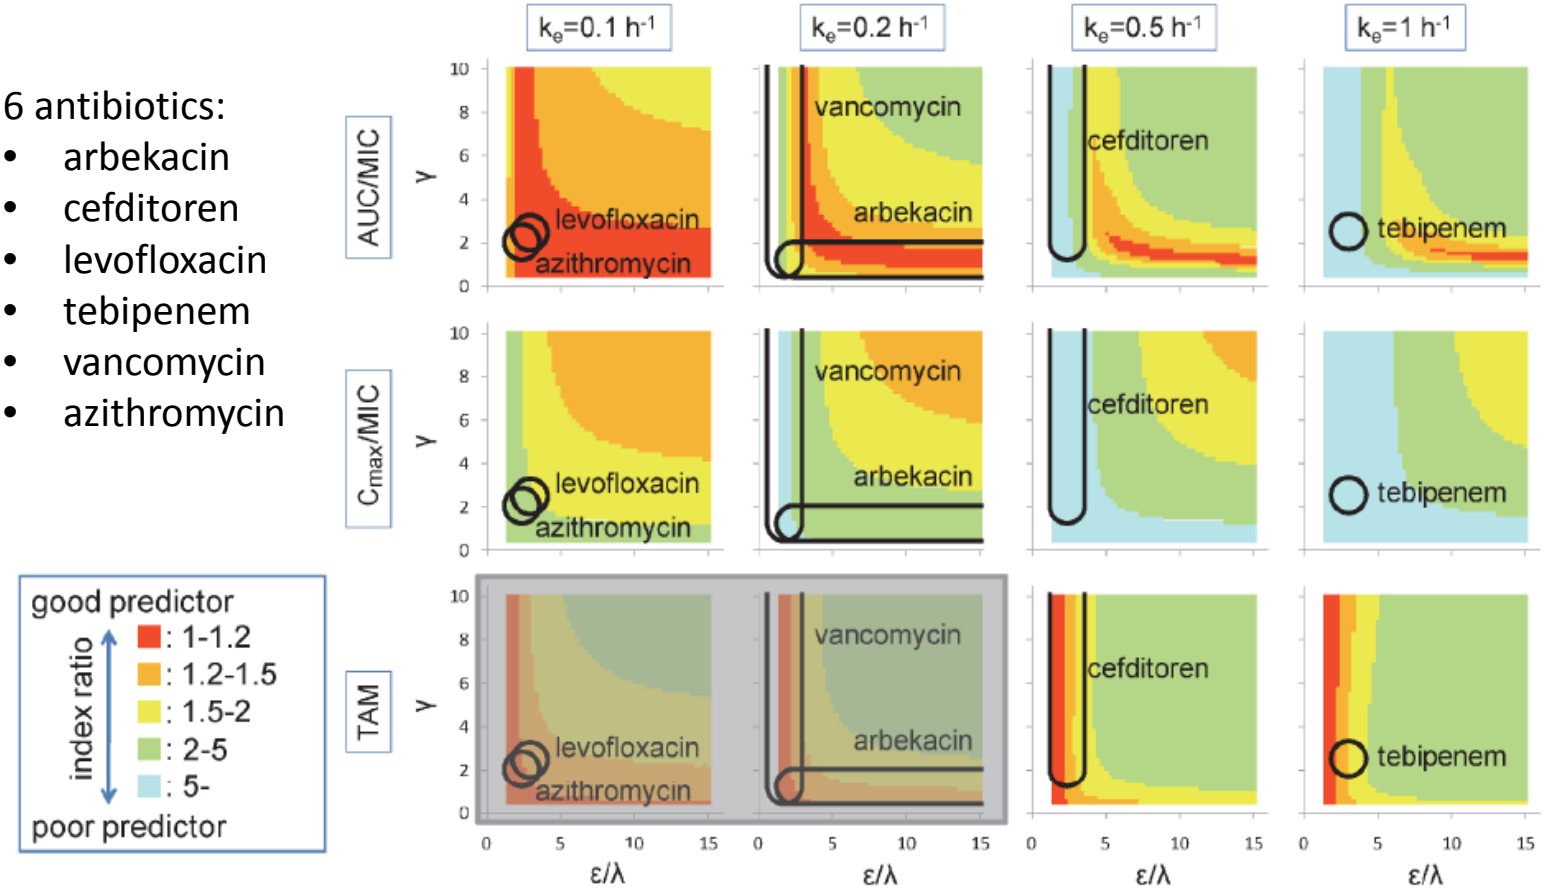
PK importance in PKPD characterization

PK/PD indices

Theoretical mathematical framework

6 antibiotics:

- arbekacin
- cefditoren
- levofloxacin
- tebipenem
- vancomycin
- azithromycin



Kitamura Y, et al. Drug Metab Pharmacokinet. 2014;29(6):455-62.

PK importance in PKPD characterization

PK/PD indices

Table 4. List of PK/PD targets for dose adjustment adopted by selected ICUs

	PK/PD targets
For dose increase	100% $fT_{>MIC}$ ($n=5$)
	100% $fT_{2-4\times MIC}$ ($n=1$)
	50% $fT_{>4\times MIC}$ ($n=1$)
	100% $fT_{>4\times MIC}$ ($n=2$)
	40% $fT_{>4\times MIC}$ ($n=1$)
	50% $fT_{>4\times MIC}$ ($n=1$)
	70% $fT_{>4\times MIC}$ ($n=1$)
Threshold of potential toxicity for dose reduction	100% $fT_{10\times MIC}$ ($n=4$)
	100% $fT_{8\times MIC}$ ($n=1$)
	100% $fT_{6\times MIC}$ ($n=1$)
	100% $fT_{4-5\times MIC}$ ($n=1$)
	steady-state concentration exceeding 2 × maximum exposure expected in general population; e.g. piperacillin >100 mg/L (>32 g/24 h in normal patients), meropenem >32 mg/L (>12 g/24 h in normal patients) ($n=1$)

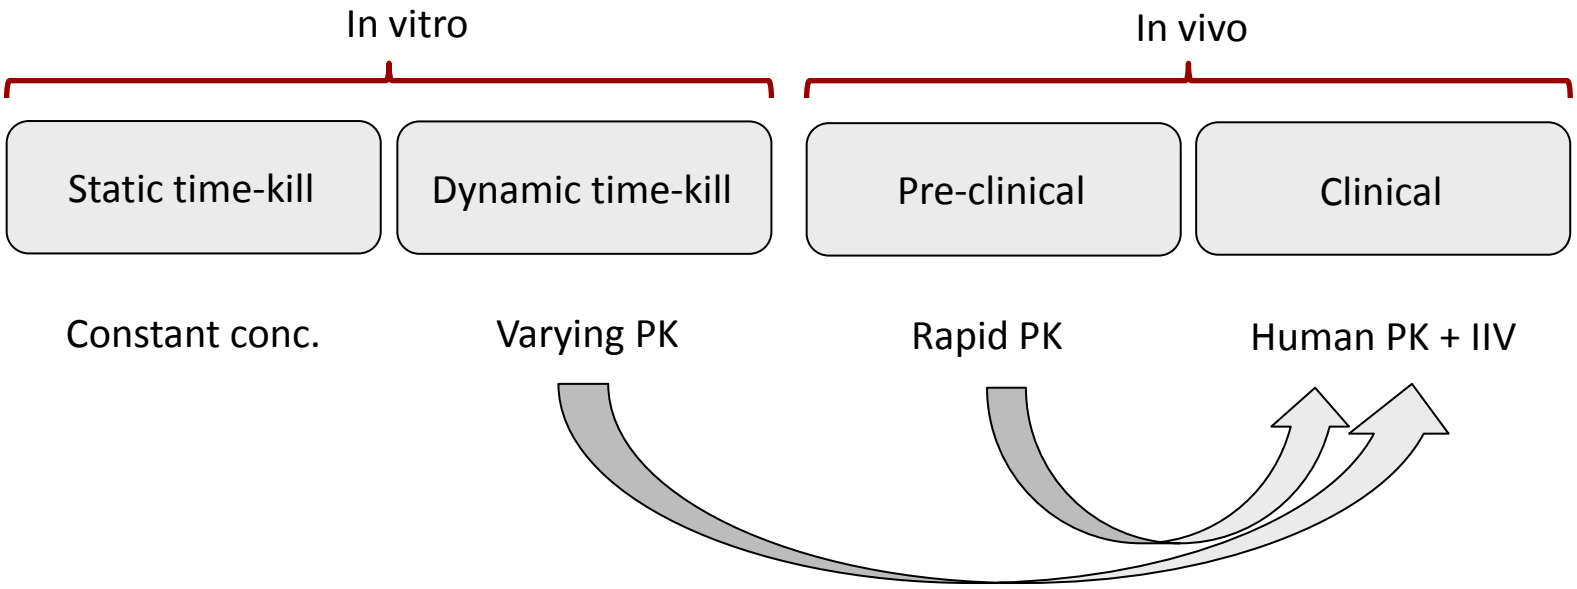
UPPSALA UNIVERSITET

PK importance in PKPD characterization

PK/PD indices vs *Pharmacometric approach*



PK/PD indices:
Correlate 24h efficacy to summary exposure

Pharmacometric approach

Make use of all available data and accumulate knowledge

- *In vitro* (static, dynamic concentration)
- *In vivo* (pre-clinical, clinical)

UPPSALA UNIVERSITET

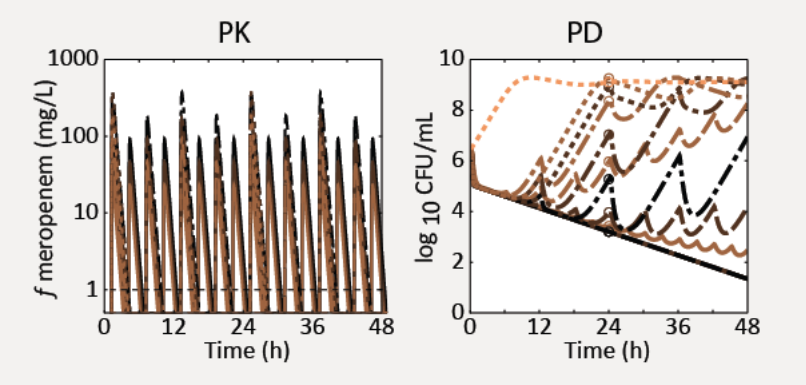
PK importance in PKPD characterization

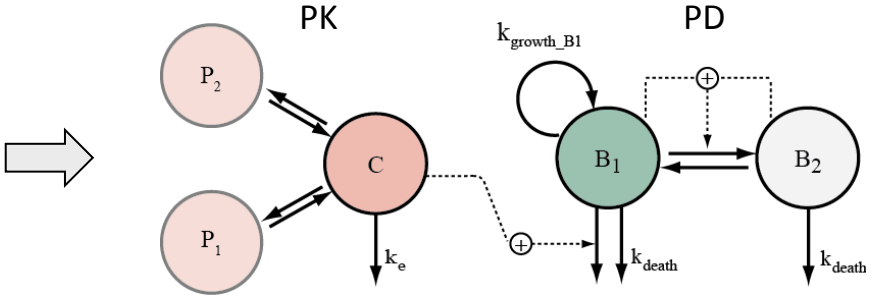
Pharmacometric approach

Translate results from experiments with varying PK profiles

Characterization of full time-course

- PK (one or several drugs)
- Bacterial effect (single and combination treatment)
- Emergence of resistance

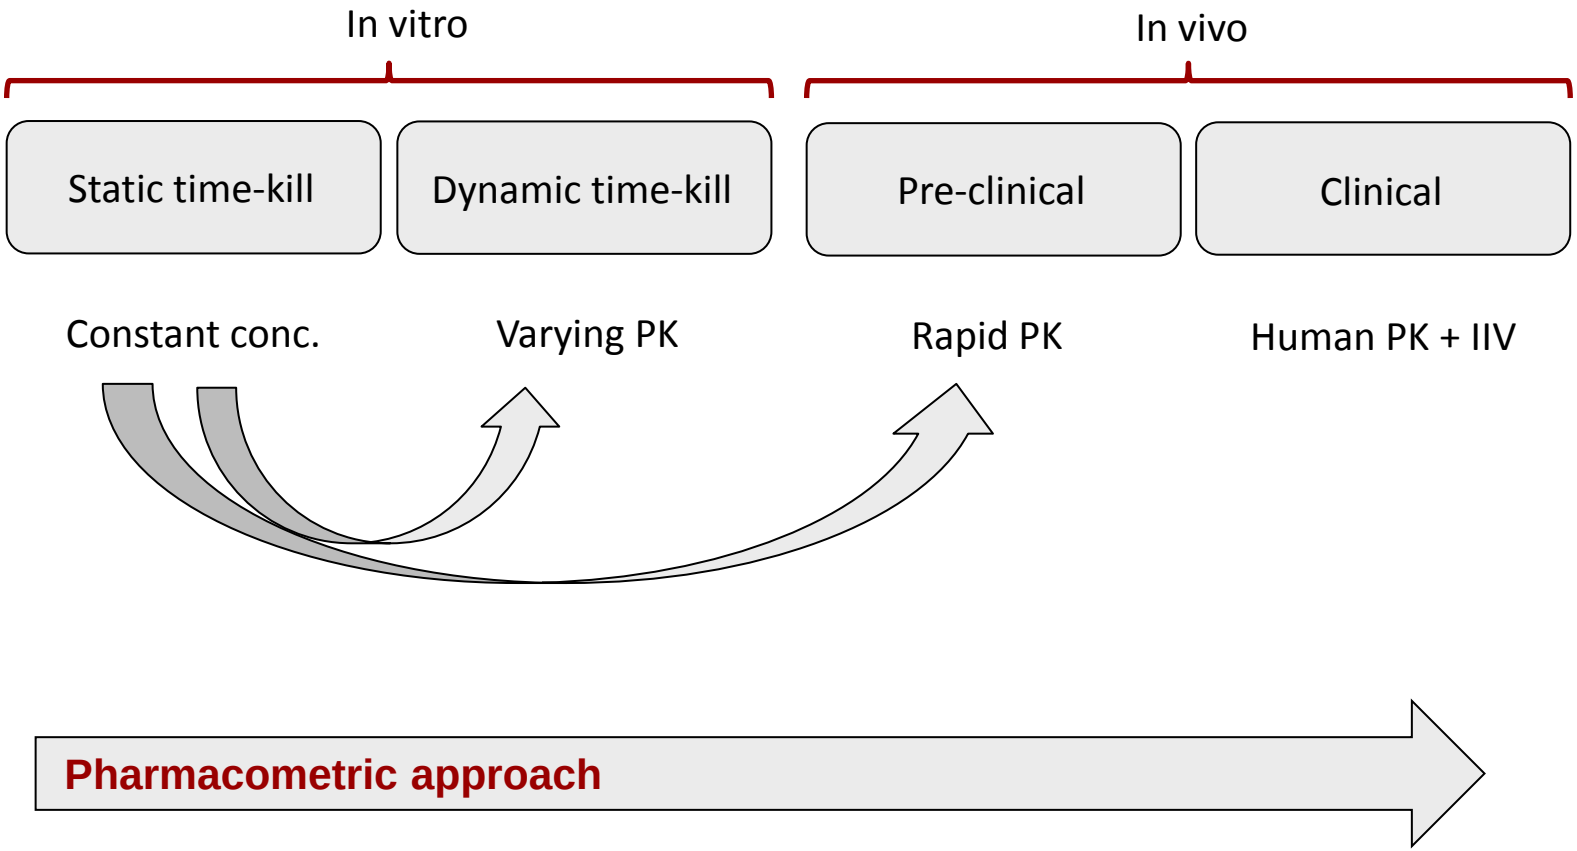




UPPSALA UNIVERSITET

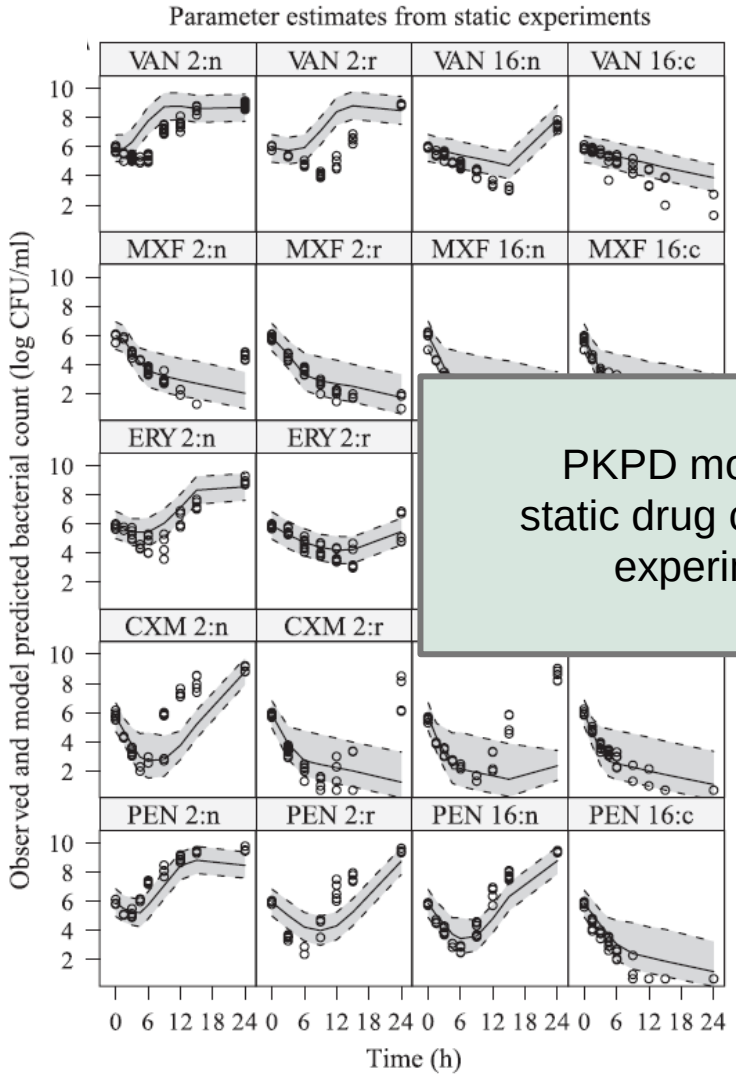
PK importance in PKPD characterization

Pharmacometric approach



PK importance in PKPD characterization

Pharmacometric approach



Are the static time-kill predictive of dynamic time-kill?

- *S. pyogenes,* 5 antibiotics
- PKPD model developed based on static
- luation
- periments

PKPD models based on experiments with static drug concentrations can be predictive of experiments with human PK profiles

2:n	C_0= 2 xMIC, $t_{1/2}$= typical human
2:r	C_0= 2 xMIC, $t_{1/2}$= 1/3 typical human
16:n	C_0=16 xMIC, $t_{1/2}$= typical human
16:c	C_0=16 xMIC, $t_{1/2}$= 0 (constant conc)

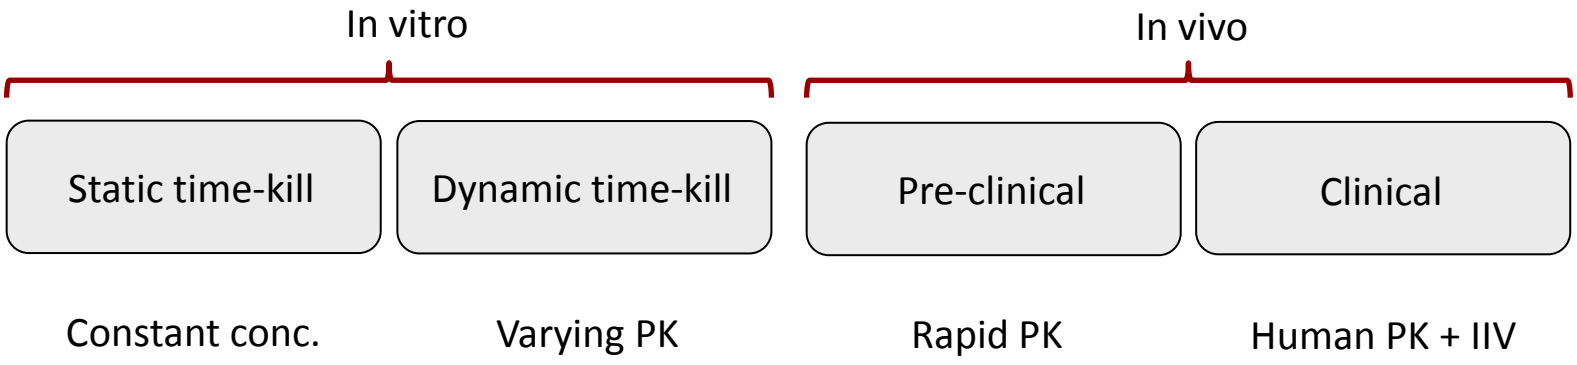
PKPD-models developed based on *in vitro* data can be predictive of *in vivo* pre-clinical results

UPPSALA UNIVERSITET

PK importance in PKPD characterization

PK/PD indices or a Pharmacometric approach



PK/PD indices:

- Summary of PK profile:
  Shape of the PK curve of importance, PK dependency might limit the predictive capacity
- Static PD endpoint:
  Relevance of 24h (or other) efficacy assessment?
- No single “true” PK/PD index

Pharmacometric approach:

- Use time-course of PK and PD
- PKPD models based on static time-kill can be predictive of dynamic exposures and vivo pre-clinical results
- Use of all available data
- Combination therapy
- Resistance development
