Prior knowledge in product development/design

Dr Keith Pugh
The aim of pharmaceutical development is to design a quality product and its manufacturing process to consistently deliver the intended performance of the product. (EU - Note for guidance on Development Pharmaceutics (CPMP/QWP/155/96))

ICH Q8 – Pharmaceutical Development

Q8: Pharmaceutical Development (May 2006)
Q8 (R1): Pharmaceutical Development Revision/Annex (November 2008)
Q8 (R2): Pharmaceutical Development – editorial corrections (June 09)

Quality by design (Q8R):

A more systematic approach to development may include, for example, incorporation of prior knowledge, results of experimental studies using design of experiments or multivariate data analysis, establishment of a control strategy, use of quality risk management, and use of knowledge management (see ICH Q10) throughout the lifecycle of the product.

Pharmaceutical Development is a dynamic, not a static process: lifecycle, continual improvement
ICH Q8 Pharmaceutical Development

Part I: Pharmaceutical Development

1. Introduction
   1.1. Objective of the Guideline
   1.2. Scope

2. Pharmaceutical development
   2.1. Components of the drug product
      2.1.1. Drug Substance
      2.1.2. Excipients
   2.2. Drug product
      2.2.1. Formulation development
      2.2.2. Overages
      2.2.3. Physicochemical and biological properties
   2.3. Manufacturing process development
   2.4. Container closure system
   2.5. Microbiological Attributes
   2.6. Compatibility

3. Glossary
ICH Q8 Pharmaceutical Development

Part II: Pharmaceutical Development – Annex

1. Introduction

2. Elements of pharmaceutical development
   2.1. Quality target product profile
   2.2. Critical quality attributes
   2.3. Risk assessment: linking material attributes and process parameters to drug product CQAs
   2.4. Design space
      2.4.1. Selection of variables
      2.4.2. Describing a design space in a submission
      2.4.3. Unit operation design space(s)
      2.4.4. Relationship of design space to scale and equipment
      2.4.5. Design space versus proven acceptable ranges
      2.4.6. Design space and edge of failure
   2.5. Control strategy
   2.6. Product lifecycle management and continual improvement
Part II: Pharmaceutical development - Annex (continued)

3. Submission of pharmaceutical development and related information in common technical documents (CTD) format

3.1. Quality risk management and product and process development
3.2. Design space
3.3. Control strategy
3.4. Drug substance related information

*Frequency of use of terms:*

The Pharmaceutical Development section should describe the knowledge that establishes that the type of dosage form selected and the formulation proposed are suitable for the intended use. This section should include sufficient information in each part to provide an understanding of the development of the drug product and its manufacturing process.

Summary tables and graphs are encouraged where they add clarity and facilitate review.

Pharmaceutical development should include, at a minimum, the following elements:

- **Defining the quality target product profile (QTPP) as it relates to quality, safety and efficacy, considering** e.g., the route of administration, dosage form, bioavailability, strength, and stability;

- **Identifying potential critical quality attributes (CQAs) of the drug product, so that those product characteristics having an impact on product quality can be studied and controlled**;

- **Determining the critical quality attributes of the drug substance, excipients etc., and selecting the type and amount of excipients to deliver drug product of the desired quality**;

- Selecting an appropriate manufacturing process ;

- **Defining a control strategy**

<td>• Preventive lifecycle management and continuous improvement</td>
</tr>
</tbody>
</table>

The product should be designed to meet patients’ and the intended product performance.

(*) Optional approach. Parts may be applied.
Example ICH Q8(R2) Enhanced Approach

- Target the product profile
- Determine critical quality attributes (CQAs)
- Link raw material attributes and process parameters to CQAs and perform risk assessment (identify what is critical)
- Develop a design space
- Design and implement a control strategy
- Manage product lifecycle, including continual improvement
2. Elements of pharmaceutical development

2.1. Quality target product profile

The quality target product profile forms the basis of design for the development of the product. Considerations for the quality target product profile could include:

- Intended use in clinical setting (patient population), route of administration, dosage form, delivery systems;
- Dosage strength(s);
- Container closure system;
- Therapeutic moiety release or delivery and attributes affecting pharmacokinetic characteristics (e.g., dissolution, aerodynamic performance) appropriate to the drug product dosage form being developed;
- Drug product quality criteria (e.g., sterility, purity, stability and drug release) appropriate for the intended marketed product.

Extent and therefore the potential role of prior knowledge will depend upon the nature of the submission:

- New drug substance
- Existing drug substance (Generic)
- Extension – new pharmaceutical form
- Variation to existing product
Quality Target Product Profile (QTPP):
A prospective summary of the quality characteristics of a drug product that ideally will be achieved to ensure the desired quality, taking into account safety and efficacy of the drug product.

Illustration: QTPP and CQAs

<tr>
<td>Film-coated tablet with a suitable size to aid patient acceptability and compliance. Total tablet weight containing 30 mg of active ingredient is 100 mg with a diameter of 6 mm.</td>
</tr>
</tbody>
</table>

Drug Product CQAs
- Assay
- Content Uniformity
- Dissolution
- Tablet Mechanical Strength

CQAs derived using Prior Knowledge (e.g. previous experience of developing tablets)
CQAs may be ranked using quality risk assessment.
2.1. Components of the drug product

2.1.1. Drug substance

The physicochemical and biological properties of the drug substance that can influence the performance of the drug product and its manufacturability, or were specifically designed into the drug substance (e.g., solid state properties), should be identified and discussed. Examples include solubility, water content, particle size, crystal properties, biological activity, and permeability.

To evaluate the potential effect of drug substance physicochemical properties on the performance of the drug product, studies on drug product might be warranted.

ICH Q6A Specifications: Test Procedures and Acceptance Criteria for New Drug Substances and New Drug Products: Chemical Substances describes some of the circumstances in which drug product studies are recommended. Approach applies equally for the ICH Q6B Specifications: Test Procedures and Acceptance Criteria for Biotechnology/Biological Products.

Knowledge gained from the studies investigating the potential effect of drug substance properties on drug product performance can be used, as appropriate, to justify elements of the drug substance specification.

Compatibility of the drug substance with excipients should be evaluated and if appropriate other drug substances in the formulation.

Prior knowledge

Will largely depend upon nature of submission.

Experience with similar drug substances/formulations
2.1.2. Excipients
Concentration, and the characteristics (functionality) that can influence the drug product performance (e.g., stability, bioavailability) or manufacturability should be discussed relative to the respective function of each excipient, including processing aids.

Compatibility should be established and the ability of the excipients to provide their intended functionality, and to perform throughout the intended drug product shelf life (e.g. preservatives, antioxidants), should also be demonstrated.

The information on excipient performance can be used, as appropriate, to justify the choice and quality attributes of the excipient, and to support the justification of the drug product specification (3.2.P.5.6).

Prior knowledge
Material attributes
Typical concentrations/experience with similar formulations
Manufacturability
Information concerning safety (paediatric use)
Specifications – Monograph e.g. Ph. Eur.,
Elemental impurities
2.2. Drug product
2.2.1. Formulation development
A summary should be provided describing the development of the formulation, including identification of those attributes that are critical to the quality of the drug product, taking into consideration intended usage and route of administration. Information from formal experimental designs can be useful in identifying critical or interacting variables that might be important to ensure the quality of the drug product.

The summary should highlight the evolution of the formulation design from initial concept up to the final design. This summary should also take into consideration the choice of drug product components (e.g., the properties of the drug substance, excipients, container closure system, any relevant dosing device), the manufacturing process, and, if appropriate, knowledge gained from the development of similar drug product(s).

Link to formulations used in clinical safety and efficacy and in any relevant bioavailability or bioequivalence studies.

Prior knowledge
Development of similar products
Dosage forms – general Pharmacopoeial monographs
Product development/design

2.4. Container closure system

The choice and rationale for selection of the container closure system for the commercial product should be discussed. Consideration should be given to the intended use of the drug product and the suitability of the container closure system for storage and transportation (shipping), including the storage and shipping container for bulk drug product, where appropriate.

The choice of materials for primary packaging should be justified. The discussion should describe studies performed to demonstrate the integrity of the container and closure. A possible interaction between product and container or label should be considered.

The choice of primary packaging materials should consider, e.g., choice of materials, protection from moisture and light, compatibility of the materials of construction with the dosage form (including sorption to container and leaching), and safety of materials of construction. Justification for secondary packaging materials should be included, when relevant.

If a dosing device is used (e.g., dropper pipette, pen injection device, dry powder inhaler), it is important to demonstrate that a reproducible and accurate dose of the product is delivered under testing conditions which, as far as possible, simulate the use of the product.

Prior knowledge

Protective properties (material specifications)
Single dose/multi-dose
Integrity of container closure system – sterile products
Monograph requirements
Experience with similar products
