ANNEX I

SUMMARY OF PRODUCT CHARACTERISTICS
This medicinal product is subject to additional monitoring. This will allow quick identification of new safety information. Healthcare professionals are asked to report any suspected adverse reactions. See section 4.8 for how to report adverse reactions.

1. **NAME OF THE MEDICINAL PRODUCT**
HEPCLUDEX 2 mg powder for solution for injection

2. **QUALITATIVE AND QUANTITATIVE COMPOSITION**
Each vial contains bulevirtide acetate equivalent to 2 mg bulevirtide.
For the full list of excipients, see section 6.1.

3. **PHARMACEUTICAL FORM**
Powder for solution for injection (powder for injection).
The powder is white to off-white.
After reconstitution, solution with a pH of approximately 9.0 and osmolality of approximately 300 mOsm/kg.

4. **CLINICAL PARTICULARS**

4.1 **Therapeutic indications**
Hepcludex is indicated for the treatment of chronic hepatitis delta virus (HDV) infection in plasma (or serum) HDV-RNA positive adult patients with compensated liver disease.

4.2 **Posology and method of administration**
Treatment should be initiated only by a physician experienced in the treatment of patients with HDV infection.

**Posology**
Bulevirtide should be administered at 2 mg once daily (every 24 h ± 4 h) by subcutaneous injection as monotherapy or in co-administration with a nucleoside/nucleotide analogue for treatment of underlying HBV infection.

Concerning co-administration with the nucleoside-nucleotide analogues for treatment of HBV infection, refer to section 4.4.

**Duration of treatment**
The optimal treatment duration is unknown. Treatment should be continued as long as associated with clinical benefit.

Consideration to discontinue the treatment should be given in case of sustained (6 months) HBsAg seroconversion or loss of virological and biochemical response.

**Missed doses**
If an injection has been omitted and less than 4 hours have elapsed since the scheduled time, the injection must be performed as soon as possible. The time of the next injection will not be calculated from the
time of the "rescue" injection, but according to the injection schedule previously established. It is, therefore, necessary to return to the usual pattern of administration, at the appointed time, the following day.

If an injection has been missed and more than 4 hours have elapsed since the scheduled time, the missed dose should not be administered.

The next injection will take place according to the usual schedule (injection of the prescribed dose without doubling), at the appointed time the next day.

If the injection has been made by mistake more than 4 hours after the scheduled time, the next administration must take place in the usual way (i.e. in accordance with the original schedule).

**Special populations**

*Elderly population*
No data is available in patients >65 years.

*Renal impairment*
No studies have been conducted with bulevirtide in patients with renal impairment. Renal function should be carefully monitored. Elevation of bile salts may occur during treatment. Due to renal excretion of bile salts, elevation of bile salts may be greater in patients with renal impairment.

*Hepatic impairment*
No dose adjustment is required for patients with mild hepatic impairment (Child-Pugh-Turcotte class A). The safety and efficacy of bulevirtide in patients with decompensated cirrhosis have not been established (see sections 4.4 and 5.2).

*Paediatric population*
The safety and efficacy of bulevirtide in patients younger than 18 years of age have not been established. No data is available.

**Method of administration**

For subcutaneous use only. Bulevirtide may be injected into sites such as the upper thigh, or abdomen. Appropriate training should be given to the patients self-administering the product to minimise the risk of the injection site reactions.

The “Instructions for the User”, provided in the carton, must be followed carefully by the patient.

For instructions on reconstitution of the medicinal product before administration, see section 6.6.

**4.3 Contraindications**

Hypersensitivity to the active substance or to any of the excipients listed in section 6.1.

**4.4 Special warnings and precautions for use**

*HDV and HBV genotype*

HDV genotype 1 was predominant in the clinical trials population. It is not known whether HDV or HBV genotype affects the clinical efficacy of bulevirtide.

*Decompensated liver disease*
The pharmacokinetics, safety and efficacy of bulevirtide in patients with decompensated cirrhosis has not been established. The use in patients with decompensated liver disease is not recommended.

Co-infection with hepatitis B virus (HBV)

The underlying HBV infection should be simultaneously managed according to current treatment guidelines. In the clinical study of bulevirtide MYR202, only patients with signs of active hepatitis despite nucleoside/nucleotide analogue treatment were included; tenofovir disoproxil fumarate was co-administered with bulevirtide. Close monitoring of HBV-DNA levels is recommended.

Hepatitis exacerbations after treatment cessation

Discontinuation of treatment with bulevirtide can lead to reactivation of the HDV and HBV infection and exacerbation of hepatitis. In case of treatment discontinuation, careful monitoring of liver function including transaminase levels, as well as HBV DNA and HDV RNA viral load should be performed.

Increase of bile salts

Asymptomatic and dose-dependent elevation of serum bile salts has been very commonly observed with bulevirtide. This increase is reversible upon discontinuation of treatment. It can be expected in the majority of patients taking into account the mechanism of action of bulevirtide which, by inactivating the NTCP (sodium taurocholate co-transporter polypeptide) receptor, blocks the transport of bile acids from portal blood to hepatocytes. In patients with renal insufficiency, the increase in bile salts may be more pronounced.

There are no data available on the long-term impact (> 48 weeks) of this bile salt increase induced by bulevirtide (see section 4.8).

Administration site reactions

Bulevirtide is intended for subcutaneous injection which is associated with risks for injection site reactions such as swelling, redness, irritation, itchiness, infection, hematoma and local pain. These local reactions are more likely to appear if the injection is accidentally misplaced or the solution accidentally misdirected to the soft tissue.

Co-infection with human immunodeficiency virus and hepatitis C virus:

No data are available from HIV or HCV co-infected patients.

Excipients:

This medicine contains less than 1 mmol sodium (23 mg) per ml, that is to say essentially "sodium-free".

4.5 Interaction with other medicinal products and other forms of interaction

In vitro, it has been shown, that certain medicinal products can inhibit bulevirtide target sodium-taurocholate co-transporting polypeptide (NTCP). The co-administration of such medicinal products (e.g. sulfasalazin, irbesartan, ezetimibe, ritonavir, and ciclosporin A) is not recommended.

As a precautionary measure, close clinical monitoring is warranted when NTCP substrates (e.g. estrone-3-sulfate, fluvastatin, atorvastatin, pitavastatin, pravastatin, rosuvastatin, and thyroid hormones) are co-administered with bulevirtide. When possible, co-administration of these substrates should be avoided.

In vitro an inhibition of OATP1B1/3 transporters by bulevirtide was observed, albeit only at a concentration ≥ 0.5 μM, which is only reached in vivo after administration of high bulevirtide doses (10 mg subcutaneous). The clinical relevance of these findings is unknown. As a precautionary measure, close clinical monitoring is warranted when OATP1B1/3 substrates (e.g. atorvastatin, bosentan,
docetaxel, fexofenadine, glecaprevir, glyburide (glibenclamide), grazoprevir, nateglinide, paclitaxel, paritaprevir, pitavastatin, pravastatin, repaglinide, rosuvastatin, simeprevir, simvastatin, olmesartan, telmisartan, valsartan, voxilaprevir) are co-administered. When possible, co-administration of these substrates should be avoided.

In a clinical study in healthy subjects, co-administration of tenofovir and bulevirtide revealed no impact on tenofovir pharmacokinetic.

No CYP inhibition by bulevirtide was observed in vivo at clinically relevant concentrations. However, in a clinical study, an approximately 40% increase in geometric mean of partial AUC_{2-4h} values of co-administered midazolam (CYP3A4 substrate) was observed in combination of high dose bulevirtide (10 mg) and tenofovir (245 mg), whereas no significant influence on midazolam AUC_{2-4h} was detected for tenofovir alone. As a precautionary measure, close clinical monitoring is warranted for co-administered narrow-therapeutic-index drugs which are sensitive CYP3A4 substrates (e.g. cyclosporine, carbamazepine, simvastatin, sirolimus, and tacrolimus).

4.6 Fertility, pregnancy and lactation

Pregnancy

There are no or limited amount of data from the use of bulevirtide in pregnant women.

Animal studies do not indicate direct or indirect harmful effects with respect to reproductive toxicity.

As a precautionary measure, it is preferable to avoid the use of bulevirtide during pregnancy and in women of child-bearing age who do not use contraception.

Breastfeeding

It is unknown whether bulevirtide is excreted in human breast milk. Therefore, a decision must be made whether to discontinue breastfeeding or to discontinue / abstain from treatment with bulevirtide, taking into account the benefit of breastfeeding for the child with regard to the benefit of treatment for the mother.

Fertility

No human data on the effect of bulevirtide on fertility are available. In animal studies, no effects of bulevirtide on male or female mating and fertility were noted.

4.7 Effects on ability to drive and use machines

The product has minor influence on the ability to drive and use machines. Patients should be informed that dizziness has been reported during treatment with bulevirtide. (see section 4.8).

4.8 Undesirable effects

Summary of the safety profile

The most frequently reported adverse reactions were asymptomatic, dose dependent and reversible (after discontinuation of treatment) increase in bile salts (very common) and injection site reactions (common) (see section 4.4).

The most frequently reported serious adverse reaction was an exacerbation of hepatitis after discontinuation of bulevirtide, possibly related to virologic rebound after discontinuation of treatment (see section 4.4).
Tabulated list of adverse reactions

Common and very common adverse reactions are listed below by system organ class and absolute frequency. Frequencies are defined as follows: very common (≥ 1/10), common (≥ 1/100, <1/10).

Description of selected adverse reactions:

ALT elevations

Most ALT elevations were reported after treatment cessation and may be related to hepatitis exacerbation after withdrawal of antiviral treatment.

Reporting of suspected adverse reactions
Reporting suspected adverse reactions after authorisation of the medicinal product is important. It allows continued monitoring of the benefit/risk balance of the medicinal product. Healthcare professionals are asked to report any suspected adverse reactions via the national reporting system listed in Appendix V.

4.9 Overdose

There are no data on human overdose with bulevirtide. If overdose occurs, the patient must be monitored for evidence of toxicity and given standard supportive treatment as necessary.

5. PHARMACOLOGICAL PROPERTIES

5.1 Pharmacodynamic properties

Pharmacotherapeutic group: antivirals for systemic use, other antivirals. ATC code: J05AX28

Mechanism of action

Bulevirtide blocks the entry of HBV and HDV into hepatocytes by binding to and inactivating NTCP, a bile salt liver transporter serving as essential HBV/HDV entry receptor.

Clinical efficacy and safety

The clinical efficacy and safety of bulevirtide was investigated in two Phase 2 studies. Patients with chronic HDV infection and active hepatitis were included. The population of both studies was mainly Caucasian, HDV genotype 1 was predominant.

**MYR 202 study**

A multicentre, open-label, randomised phase 2 clinical study evaluated the efficacy and safety of three doses of bulevirtide (2 mg/day, 5 mg/day and 10 mg/day) for 24 weeks in patients with chronic hepatitis D with liver cirrhosis, or who failed previous interferon therapy, or for whom such therapy was contraindicated (including history of interferon intolerance). Study participants received either daily subcutaneous injections of bulevirtide 2 mg/day, 5 mg/day and 10 mg/day on top of tenofovir (tablets), or tenofovir alone for 24 weeks. 50% of the study participants had liver cirrhosis at baseline. Participants had compensated liver disease, mean age was 40.2 (9.5) years, 66.9% were male, 85.6% were Caucasians, 13.6% Asians and 0.8% Black. Patients had active hepatitis with mean levels ALT of 115 (79.5) U/L. Patients with HIV and active HCV infection were excluded. Baseline characteristics were comparable between treatment arms. The primary endpoint of the study was undetectable HDV RNA or decrease by ≥2log₁₀ from baseline to week 24.

The table below summarises the efficacy results in mITT population at week 24:

<table>
<thead>
<tr>
<th>HDV RNA response</th>
<th>Arm A: (n=28) 2mg bulevirtide + TDF</th>
<th>Arm B: (n=32) 5mg bulevirtide + TDF</th>

<th>40.0%*</th>
<th>7.1%</th>
</tr>
</thead>
</table>

*p-value ≤ 0.05 TDF=tenofovir disoproxil fumarate
ALT values ≤31 U/L for female and ≤41 U/L for male were considered normal

In this study, 25 participants developed anti-drug antibodies (ADA). No evidence of these ADA on the pharmacokinetics nor on the efficacy of Hepcludex was observed.

**MYR 203 study**
In study 203, a total of 15 patients were treated with bulevirtide 2 mg daily for 48 weeks. In this limited dataset, the efficacy and safety profiles were not substantially different than for patients treated for 24 weeks. Two subjects developed virological breakthrough, possibly related to medication non-adherence.

**Paediatric population**

The European Medicines Agency has deferred the obligation to submit the results of studies with Hepcludex in one or more subsets of the paediatric population for the treatment of chronic hepatitis D infection (see section 4.2 for information on paediatric use).

This medicinal product has been authorised under a so-called ‘conditional approval’ scheme. This means that further evidence on this medicinal product is awaited.
The European Medicines Agency will review new information on this medicinal product at least every year and this SmPC will be updated as necessary.
5.2 Pharmacokinetic properties

The pharmacokinetic properties of bulevirtide were characterised after intravenous and subcutaneous administration. The exposure of bulevirtide increased disproportionally while the clearance and volume of distribution decreased with higher doses.

Distribution

The estimated volume of distribution is smaller than total body water. In vitro plasma protein binding is high with >99% of bulevirtide bound to plasma proteins.

Biotransformation

No biotransformation study was performed for bulevirtide. Bulevirtide is a linear peptide consisting of L-amino acids, and it is expected to be degraded to smaller peptides and individual amino acids. No active metabolites are expected.

Based on the results of in vitro interaction studies, bulevirtide did not inhibit CYP1A2, CYP2A6, CYP2B6, CYP2C9, CYP2C19, CYP2D6 and CYP3A4.

No in vitro induction of CYP1A2, CYP2B6 or CYP3A4 by bulevirtide was observed.

Based on the in vitro studies, no clinically relevant interaction is expected for most common efflux transporters (MDR1, BCRP, BSEP, MATE1 and MATE2K) and uptake transporters (OATP2B1, OAT1, OAT3, OCT1 and OCT2). A specific in vitro interaction was identified with the organic anion transporting polypeptides, OATP1B1 and OATP1B3 with IC50 values of 0.5 and 8.7µM, respectively.

Elimination

No bulevirtide excretion into urine was detected in healthy volunteers. Elimination via target (NTCP) binding is assumed to be the main route. Both distribution and elimination after multiple dosing were reduced compared to values estimated after the first dose. Accumulation ratios for 2 mg dose for Cmax and AUC were approximately 2-fold. Steady state is assumed to be achieved within the first weeks of administration. After reaching peak concentrations, plasma levels declined with t1/2 of 4-7 hours.

Renal impairment

No studies have been conducted with bulevirtide in patients with renal impairment.

Hepatic impairment

No studies have been conducted with bulevirtide in patients with moderate and severe hepatic impairment.

Elderly

No data is available in patients older than 65 years of age.

Paediatric population

No data is available in patients younger than 18 years of age.

5.3 Preclinical safety data

Non-clinical data reveal no special hazard for humans based on conventional studies of safety pharmacology, single and repeated dose toxicity, and toxicity to reproduction and development.

No genotoxicity and carcinogenicity studies were conducted due to the nature and mechanism of action of the product.

A pre- and post-natal development study (PPND) has been completed in rats and did not show any bulevirtide-related toxicity.
6. PHARMACEUTICAL PARTICULARS

6.1 List of excipients

Sodium carbonate anhydrous
Sodium hydrogen carbonate
Mannitol
Hydrochloric acid (for pH adjustment)
Sodium hydroxide (for pH adjustment)

6.2 Incompatibilities

This medicinal product must not be mixed with other medicinal products, except those mentioned in section 6.6.

6.3 Shelf life

24 months.

After reconstitution, chemical and physical in-use stability has been demonstrated for 2 hours at room temperature (up to 25°C). From a microbiological point of view, it is recommended that the product should be used immediately.

6.4 Special precautions for storage

Store in a refrigerator (2°C -8°C). In order to protect from light, keep the vials in the outer carton.

6.5 Nature and contents of container

Colourless glass vial with bromobutyl rubber stopper, sealed with a flip off cap (aluminium with plastic disc).

Pack-size of 30 vials.

6.6 Special precautions for disposal and other handling

Each vial is intended for single use only and the excess of unused product must be properly disposed of. Water for injections, syringes, needle tips and alcohol wipes should be provided to the patient.

Instructions for use

The bulevirtide vial should be taken from the refrigerator shortly before the injection and the blue flip-off cap has to be removed. A single-use syringe should be taken and a needle tip attached to the syringe head in order to extract 1 ml of water for injection into the syringe. The syringe needle with the syringe containing the water for injection should then be inserted into the bulevirtide vial through the rubber stopper. The water for injection inside the syringe will then be injected into the bulevirtide vial and the bulevirtide vial has to be swayed carefully until a clear solution is obtained. The complete content of the bulevirtide vial has to be extracted back into the same syringe with the same needle tip. The needle tip has then to be detached from the syringe. To this syringe, a needle tip for subcutaneous injection has to be attached and any remaining air bubbles have to be removed from the syringe prior to injection. The content of the bulevirtide vial will then be administered subcutaneously.

Disposal of medicinal product and auxiliary components

All used components/ waste should be handled according to the current regulation.
Any unused medicinal product or waste material should be disposed of in accordance with local requirements.

7. MARKETING AUTHORISATION HOLDER

Gilead Sciences Ireland UC
Carrigtohill
County Cork, T45 DP77
Ireland

8. MARKETING AUTHORISATION NUMBER(S)

EU/1/20/1446/001

9. DATE OF FIRST AUTHORISATION/RENEWAL OF THE AUTHORISATION

Date of first authorisation: 31 July 2020
Date of latest renewal: 02 August 2021

10. DATE OF REVISION OF THE TEXT

Detailed information on this medicinal product is available on the website of the European Medicines Agency http://www.ema.europa.eu.
ANNEX II

A. MANUFACTURER(S) RESPONSIBLE FOR BATCH RELEASE

B. CONDITIONS OR RESTRICTIONS REGARDING SUPPLY AND USE

C. OTHER CONDITIONS AND REQUIREMENTS OF THE MARKETING AUTHORISATION

D. CONDITIONS OR RESTRICTIONS WITH REGARD TO THE SAFE AND EFFECTIVE USE OF THE MEDICINAL PRODUCT

E. SPECIFIC OBLIGATION TO COMPLETE POST-AUTHORISATION MEASURES FOR THE CONDITIONAL MARKETING AUTHORISATION
A. MANUFACTURER(S) RESPONSIBLE FOR BATCH RELEASE

Name and address of the manufacturer(s) responsible for batch release

Lyocontract GmbH
Pulverwiese 1
38871 Ilsenburg
Germany

Gilead Sciences Ireland UC
IDA Business and Technology Park
Carraigtohill
Co. Cork
Ireland

The printed package leaflet of the medicinal product must state the name and address of the manufacturer responsible for the release of the concerned batch.

B. CONDITIONS OR RESTRICTIONS REGARDING SUPPLY AND USE

Medicinal product subject to restricted medical prescription (see Annex I: Summary of Product Characteristics, section 4.2).

C. OTHER CONDITIONS AND REQUIREMENTS OF THE MARKETING AUTHORISATION

• Periodic safety update reports (PSURs)

The requirements for submission of PSURs for this medicinal product are set out in the list of Union reference dates (EURD list) provided for under Article 107c(7) of Directive 2001/83/EC and any subsequent updates published on the European medicines web-portal.

The marketing authorisation holder (MAH) shall submit the first PSUR for this product within 6 months following authorisation.

D. CONDITIONS OR RESTRICTIONS WITH REGARD TO THE SAFE AND EFFECTIVE USE OF THE MEDICINAL PRODUCT

• Risk management plan (RMP)

The marketing authorisation holder (MAH) shall perform the required pharmacovigilance activities and interventions detailed in the agreed RMP presented in Module 1.8.2 of the marketing authorisation and any agreed subsequent updates of the RMP.

An updated RMP should be submitted:
  • At the request of the European Medicines Agency;
  • Whenever the risk management system is modified, especially as the result of new information being received that may lead to a significant change to the benefit/risk profile or as the result of an important (pharmacovigilance or risk minimisation) milestone being reached.

E. SPECIFIC OBLIGATION TO COMPLETE POST-AUTHORISATION MEASURES FOR THE CONDITIONAL MARKETING AUTHORISATION
This being a conditional marketing authorisation and pursuant to Article 14-a of Regulation (EC) No 726/2004, the MAH shall complete, within the stated timeframe, the following measures:

B. PACKAGE LEAFLET
Package leaflet: Information for the patient

Hepcludex 2 mg powder for solution for injection
bulevirtide

This medicine is subject to additional monitoring. This will allow quick identification of new safety information. You can help by reporting any side effects you may get. See the end of section 4 for how to report side effects.

Read all of this leaflet carefully before you start using this medicine because it contains important information for you.
- Keep this leaflet. You may need to read it again.
- If you have any further questions, ask your doctor or nurse.
- This medicine has been prescribed for you only. Do not pass it on to others. It may harm them, even if their signs of illness are the same as yours.
- If you get any side effects, talk to your doctor or nurse. This includes any possible side effects not listed in this leaflet. See section 4.

What is in this leaflet

1. What Hepcludex is and what it is used for
2. What you need to know before you take Hepcludex
3. How to take Hepcludex
4. Possible side effects
5. How to store Hepcludex
6. Contents of the pack and other information
7. Step-by-step injection guide

1. What Hepcludex is and what it is used for

What Hepcludex is
Hepcludex contains the active substance bulevirtide, which is an antiviral medicine.

What Hepcludex is used for
Hepcludex is used to treat long-term (chronic) hepatitis delta virus (HDV) infection in adults with compensated liver disease (when the liver is still working well enough). Infection with hepatitis delta virus causes inflammation of the liver.

How Hepcludex works
HDV uses a particular protein in liver cells to enter the cells. Bulevirtide, the active substance in this medicine blocks the protein and so prevents the HDV from getting into liver cells. This reduces the spread of HDV in the liver and reduces inflammation.

2. What you need to know before you take Hepcludex

Do not take Hepcludex:
- if you are allergic to bulevirtide or any of the other ingredients of this medicine (listed in section 6).

If you are not sure, speak to your doctor before taking this medicine.
**Warnings and precautions**
Do not stop your treatment with Hepcludex unless your doctor advises you to do so. Stopping the treatment can reactivate the infection and worsen your disease.

Talk to your doctor or pharmacist before taking Hepcludex:

- if your liver is not working well enough – it is not known how well Hepcludex works in these circumstances; if your liver is not functioning well, taking Hepcludex is not recommended.

- if you have had kidney disease or if tests have shown problems with your kidneys. Before and during treatment, your doctor may order blood tests to check how well your kidneys are working;

- if you have HIV infection or hepatitis C - it is not known how well Hepcludex works in these circumstances; your doctor may order blood tests to check the status of your HIV or hepatitis C infection

- if you get reactions such as swelling, redness, irritation, bruising, itchiness, infection or pain at the injection site – this medicine is given by injection under the skin.

- if you have an elevation of bile acids in the blood. Hepcludex increases the level of bile acids in the blood – the long-term effect of bile acid elevation is not known.

**Children and adolescents**
Children and adolescents under 18 years of age should not be treated with Hepcludex.

**Other medicines and Hepcludex**
Please tell your doctor if you are taking, have recently taken, or might take any other medicines. Some medicines can increase side effects of Hepcludex and you should not take them at the same time. This is why you should tell your doctor if you are taking any of these medicines:

- ciclosporin, a medicine that supresses the immune system;
- ezetimibe, used for treating high blood cholesterol;
- irbesartan, used for treating high blood pressure and heart disease;
- ritonavir, used to treat HIV infection;
- sulfasalazine, (used for treating rheumatoid arthritis, ulcerative colitis, and Crohn's disease.

Some medicines can increase or decrease the effects of Hepcludex when taken together. In some cases, you may need to have certain tests or your doctor may change the dose or monitor you regularly:

- cancer treatments (e.g. dasatinib, docetaxel, ibrutinib, paclitaxel);
- antihistamine medicines used for allergies (e.g. ebastine, fexofenadine);
- immune system medicines (e.g. everolimus, sirolimus, tacrolimus);
- medicines for hepatitis C and HIV treatment (e.g. darunavir, glecaprevir, grazoprevir, indinavir, maraviroc, paritaprevir, saquinavir, simeprevir, tipranavir, voxilaprevir);
- medicines for diabetes (e.g. glibenclamide, nateglinide, repaglinide);
- medicines for erectile dysfunction (e.g., avanafil, sildenafil, vardenafil);
- medicines for treating high blood pressure and heart disease (e.g. olmesartan, telmisartan, valsartan);
- statin, medicines used for high blood cholesterol (e.g. atorvastatin, fluvastatin, lovastatin, pitavastatin, pravastatin, rosuvastatin, simvastatin);  
- thyroid hormones used to treat thyroid problems;
- alfentanil, an opioid medicine used to treat severe pain;
- bosentan, used for pulmonary arterial hypertension;
- buspirone, an anxiety medicine;
• budesonide, used for asthma and chronic obstructive pulmonary disease;
• conivaptan and tolvaptan, used to treat hyponatraemia (low sodium levels);
• darifenacin, used to treat urinary incontinence;
• dronedarone, heart medicine for cardiac arrhythmias;
• eletriptan, used for migraine headaches;
• eplerenone, used for high blood pressure;
• estrone-3-sulfate a menopausal hormone medicine;
• felodipine and nisoldipine (heart medicines);
• lomitapide, used for high blood cholesterol;
• lurasidone and quetiapine, antipsychotic medicines for psychiatric disorders;
• midazolam and triazolam, medicines to treat insomnia (inability to sleep) and for anaesthesia (to avoid pain during surgery);
• naloxegol, used to treat dependence on opioid medicines for severe pain;
• ticagrelor, anticoagulant to prevent blood clotting.

Pregnancy, breastfeeding and fertility
If you are pregnant or breastfeeding, think you may be pregnant or are planning to have a baby, ask your doctor for advice before taking this medicine. You should not use this medicine unless specifically told to by your doctor.

If you are a woman of childbearing potential, you should not take this medicine without using an effective method of contraception.

Talk to your doctor to decide whether you should breastfeed while taking Hepcludex. It is not known whether Hepcludex can pass into breast milk. Therefore, a decision must be made whether to discontinue breastfeeding or to discontinue Hepcludex.

Driving and using machines
Dizziness and tiredness are side effects which may impair your ability to drive and use machines. If you have any concerns consult your doctor.

Sodium content
This medicine contains less than 1 mmol sodium (23 mg) per ml, that is to say essentially "sodium-free".

3. How to take Hepcludex

Always take this medicine exactly as your doctor has told you. Check with your doctor if you are not sure.

Dosage
The recommended dose is 2 mg once daily by subcutaneous injection (just under the skin). Your doctor will say how long you need to take the medicine for.

Your doctor and nurse will show you how to prepare and inject Hepcludex. This package leaflet contains a step-by-step injection guide to help you inject the medicine (see Section 7).

If you take more Hepcludex than you should
The usual dose is 2 mg (1 vial) per day. If you think you may have taken more than you should, tell your doctor immediately.

If you forget to take Hepcludex
If less than 4 hours have passed since your missed dose of Hepcludex, take the missing dose as soon as possible and take your next scheduled dose at the usual time.

If more than 4 hours have passed since your missed dose of Hepcludex, do not take the missed dose. Take the next dose the following day at the usual time. Do not take a double dose to make up for the missed dose. Tell your doctor if you have missed a dose of Hepcludex.

**Do not stop taking Hepcludex without speaking with your doctor**

If you do not want to take Hepcludex anymore, talk to your doctor before stopping the treatment. Stopping the treatment can reactivate the infection and worsen your disease. Tell your doctor immediately about any changes in symptoms after stopping treatment.

If you have any further questions on the use of Hepcludex, ask your doctor or nurse.

### 4. Possible side effects

Like all medicines, this medicine can cause side effects, although not everybody gets them.

Please tell your doctor if any of the side effects occur, or if you notice any side effects not listed in this leaflet.

The following side effect is **very common** (this may affect more than 1 in 10 people):

- an increase in the level of bile acids in the blood.

The following side effects are **common** (these may affect up to 1 in 10 people):

- headache
- dizziness
- nausea
- tiredness
- sleepiness
- faster than normal heartbeat (tachycardia)
- flu-like illness
- swollen abdomen (belly)
- itching
- joint pain
- muscle spasms
- reactions at the injection site that may include swelling, redness, irritation, bruising, itchiness, infection or pain
- excessive or uncontrolled sweating
- blood in urine
- redness of the skin
- rash.

*Blood tests may also show:*

- an increase in liver enzyme levels and bilirubin in the blood. These are usually raised in most diseases that cause damage to the liver;
- a decrease in red blood cells (anaemia);
- a reduction in immature red blood cells (reticulocytes);
- a reduction in white blood cells (eosinophils, lymphocytes, neutrophils), or platelets (thrombocytes) in the blood;
- a reduction in the level of haemoglobin in the blood;
- an increase in the level of amylase and lipase in the blood (signs of possible pancreas damage);
- an increase of the international normalised ratio (INR) for blood clotting (which increases the risk of bleeding and bruising);
- An increase in the level of creatinine in the blood (a sign of kidney damage).

**Reporting of side effects**
If you get any side effects, talk to your doctor or nurse. This includes any possible side effects not listed in this leaflet. You can also report side effects directly via the national reporting system listed in Appendix V. By reporting side effects, you can help to provide more information on the safety of this medicine.

5. **How to store Hepcludex**

Keep this medicine out of the sight and reach of children.

Do not use this medicine after the expiry date which is stated on the carton and vial after EXP. The expiry date refers to the last day of that month.

Store in a refrigerator (2°C - 8°C). In order to protect from light, keep the vials in the outer carton.

The reconstituted solution should be used immediately. However, if this is not possible it can be stored for up to 2 hours at a temperature of up to 25°C.

Do not throw away any medicines or used needles via wastewater or household waste. Ask your pharmacist how to safely dispose medicines and used needles.

6. **Contents of the pack and other information**

**What Hepcludex contains**
The active substance is bulevirtide 2 mg. Each vial contains bulevirtide acetate equivalent to 2 mg bulevirtide.

The other ingredients are: sodium carbonate anhydrous, sodium hydrogen carbonate, mannitol, hydrochloric acid, sodium hydroxide.

**What Hepcludex looks like and contents of the pack**
Bulevirtide is a powder for solution for injection and comes as a white to off-white powder. Each carton contains 30 single doses.

This leaflet was last revised in <{MM/YYYY}><{month YYYY}>.

This medicine has been given ‘conditional approval’. This means that there is more evidence to come about this medicine.
The European Medicines Agency will review new information on this medicine at least every year and this leaflet will be updated as necessary.

<Other sources of information>

Detailed information on this medicine is available on the European Medicines Agency web site: http://www.ema.europa.eu <, and on the website of {name of Member State Agency (link)}>. <There are also links to other websites about rare diseases and treatments.>

<The following information is intended for healthcare professionals only:>
7. **Step-by-step injection guide**

Before using Hepcludex, you must first read Sections 1 – 6 of this package leaflet. Before you begin treatment with this medicine at home, your doctor or nurse will show you how to prepare and inject Hepcludex. This guide shows how to inject the medicine yourself. Speak with your doctor or nurse if you are unclear about anything or you have questions or need more information or help. Take your time to carefully prepare and inject Hepcludex.

### Injection sites

In order to reduce injection site reactions, you may change the site of bulevirtide injection regularly. **Do not inject** bulevirtide into the following areas: knee, groin, the lower or inner buttocks, directly over a blood vessel, around the navel (belly button), on scar tissue, a bruise, a mole, a surgical scar, tattoo or burn site, or where there is an injection site reaction.

### Storage

Bulevirtide vials must be stored in the original packaging in the refrigerator (2–8 °C) in order to protect bulevirtide from light.

### Mixing doses

Reconstituted bulevirtide must be used immediately. The following instructions are for dissolving a single dose.

### Wash hands

Wash your hands well using soap and warm water and dry them with a clean towel. Once your hands are clean, **do not touch anything else other than the medicine, supplies and the area around the injection site.**

### Clean vial

Wipe the vial top with a new alcohol pad and let the top air-dry. If you touch the rubber top- after cleaning it, clean it again with a new alcohol pad.
Pick up the syringe. Put the longer needle on.

**Important!** Be sure the capped needle is tight by pushing it down slightly while twisting it clockwise.

Pull off the plastic cap.

Open the water for injection. Insert the needle in the vial and gently turn the water vial upside down. Make sure the tip of the needle is always below the surface of the water to help keep air bubbles from entering the syringe.

Slowly pull the plunger back to get 1.0 cc/ml of sterile water into the syringe. Carefully remove the needle and syringe from the vial.

Gently tap the bulevirtide vial to loosen the powder. Insert the needle with sterile water into the bulevirtide vial at an angle. Inject the sterile water slowly, so it can drip down the side of the vial into the bulevirtide powder.

Gently tap the bulevirtide vial with your fingertip for 10 sec to start dissolving the powder. Then gently roll the bulevirtide vial between your hands to ensure thorough mixing. Make sure no bulevirtide powder is stuck to the vial wall.

**Important!** Do not shake the bulevirtide vial. Shaking will make the medicine foam and it will take much longer to dissolve.
Once the powder starts to dissolve, just set it aside and it completely will dissolve. After tapping, it could take up to 3 min to dissolve. When mixed completely, the bulevirtide solution should be clear. **Important!** Completely dissolved bulevirtide should be clear and without foam. If the bulevirtide solution appears foamy or yellowish, allow more time for it to dissolve. If you see bubbles, gently tap the vial until they disappear. If you see any particles in the bulevirtide solution once it is (completely) dissolved, do not use that vial. Contact your doctor or pharmacist that provided it.
Pick up the syringe. Insert the needle into the vial of liquid bulevirtide.

Gently turn the vial upside down. Make sure the tip of the needle is always below the surface of the bulevirtide solution to help keep air bubbles from entering the syringe. Slowly pull the plunger to get 1.0 cc/ml of bulevirtide.

Gently tap or flick the syringe and push/pull the plunger to remove extra air and bubbles. To be sure you end up with 1.0 cc/ml of bulevirtide in the syringe, you may need to pull the plunger past the 1.0 cc/ml mark. Carefully remove the needle and syringe from the vial.

Remove the longer needle from the syringe and dispose of it properly so that nobody can be injured. **Important!** Do not put the plastic cap back on the needle.

**Place the shorter needle on the syringe.**

**Important!** Be sure the capped needle is tight by pushing it down slightly while twisting it clockwise.

**Pull off the plastic cap.**

Choose a site different from the one you used for your last injection. Clean the injection site with a new alcohol pad. Start in the center, apply pressure and clean in a circular motion, working outward. **Important!** Allow site to air-dry.

Prepare bulevirtide vial. Clean the bulevirtide vial top again, using a new alcohol pad. Allow it to air-dry.

Pinch and hold a fold of skin around the injection site.

Pierce the skin at a 45-degree angle. The needle should be inserted most of the way in. Slowly push the plunger all the way to inject bulevirtide. Remove the needle from skin. Remove the needle from the syringe and dispose of both properly so that nobody can be injured (see 3D).
