

ANNEX I
SUMMARY OF PRODUCT CHARACTERISTICS

1. NAME OF THE MEDICINAL PRODUCT

Kadcyla 100 mg powder for concentrate for solution for infusion
Kadcyla 160 mg powder for concentrate for solution for infusion

2. QUALITATIVE AND QUANTITATIVE COMPOSITION

Kadcyla 100 mg powder for concentrate for solution for infusion

One vial of powder for concentrate for solution for infusion contains 100 mg of trastuzumab emtansine. After reconstitution one vial of 5 mL solution contains 20 mg/mL of trastuzumab emtansine (see section 6.6).

Kadcyla 160 mg powder for concentrate for solution for infusion

One vial of powder for concentrate for solution for infusion contains 160 mg of trastuzumab emtansine. After reconstitution one vial of 8 mL solution contains 20 mg/mL of trastuzumab emtansine (see section 6.6).

Excipients with known effect

Each 100 mg vial contains 1.38 mg of sodium and 1.1 mg of polysorbate 20.
Each 160 mg vial contains 2.24 mg of sodium and 1.7 mg of polysorbate 20.

For the full list of excipients, see section 6.1.

Trastuzumab emtansine is an antibody-drug conjugate that contains trastuzumab, a humanised IgG1 monoclonal antibody produced by mammalian (Chinese hamster ovary) cell suspension culture, covalently linked to DM1, a microtubule inhibitor, via the stable thioether linker MCC (4-[N-maleimidomethyl] cyclohexane-1-carboxylate).

3. PHARMACEUTICAL FORM

Powder for concentrate for solution for infusion.

White to off-white lyophilised powder.

4. CLINICAL PARTICULARS

4.1 Therapeutic indications

Early Breast Cancer (EBC)

Kadcyla, as a single agent, is indicated for the adjuvant treatment of adult patients with HER2-positive early breast cancer who have residual invasive disease, in the breast and/or lymph nodes, after neoadjuvant taxane-based and HER2-targeted therapy.

Metastatic Breast Cancer (MBC)

Kadcyla, as a single agent, is indicated for the treatment of adult patients with HER2-positive, unresectable locally advanced or metastatic breast cancer who previously received trastuzumab and a taxane, separately or in combination. Patients should have either:

- Received prior therapy for locally advanced or metastatic disease, or
- Developed disease recurrence during or within six months of completing adjuvant therapy.

4.2 Posology and method of administration

Kadcyla should only be prescribed by a physician and administered as an intravenous infusion under the supervision of a healthcare professional who is experienced in the treatment of cancer patients (i.e. prepared to manage allergic/anaphylactic infusion reactions and in an environment where full resuscitation facilities are immediately available (see section 4.4)).

Patients treated with trastuzumab emtansine should have HER2 positive tumour status, defined as a score of 3 + by immunohistochemistry (IHC) or a ratio of ≥ 2.0 by in situ hybridization (ISH) or by fluorescence *in situ* hybridization (FISH) assessed by a CE-marked In Vitro Diagnostic (IVD) medical device. If a CE-marked IVD is not available, the HER2-status should be assessed by an alternate validated test.

In order to prevent medicinal product errors it is important to check the vial labels to ensure that the medicinal product being prepared and administered is Kadcyla (trastuzumab emtansine) and not another trastuzumab-containing product (e.g. trastuzumab or trastuzumab deruxtecan).

Posology

The recommended dose of trastuzumab emtansine is 3.6 mg/kg bodyweight administered as an intravenous infusion every 3 weeks (21-day cycle).

The initial dose should be administered as a 90 minute intravenous infusion. Patients should be observed during the infusion and for at least 90 minutes following the initial infusion for fever, chills, or other infusion-related reactions. The infusion site should be closely monitored for possible subcutaneous infiltration during administration. Cases of delayed epidermal injury or necrosis following extravasation have been observed in the post-marketing setting (see section 4.4 and 4.8).

If the prior infusion was well tolerated, subsequent doses of trastuzumab emtansine may be administered as 30 minute infusions. Patients should be observed during the infusion and for at least 30 minutes after infusion.

The infusion rate of trastuzumab emtansine should be slowed or interrupted if the patient develops infusion-related symptoms (see sections 4.4 and 4.8). Trastuzumab emtansine should be discontinued in case of life-threatening infusion reactions.

Duration of treatment

Early Breast Cancer (EBC)

Patients should receive treatment for a total of 14 cycles unless there is disease recurrence or unmanageable toxicity.

Metastatic Breast Cancer (MBC)

Patients should receive treatment until disease progression or unmanageable toxicity.

Dose modification

Management of symptomatic adverse reactions may require temporary interruption, dose reduction, or treatment discontinuation of trastuzumab emtansine as per guidelines provided in text and Tables 1 and 2.

Trastuzumab emtansine dose should not be re-escalated after a dose reduction is made.

Table 1 Dose reduction schedule

Dose reduction schedule (Starting dose is 3.6 mg/kg)	Dose to be administered
First dose reduction	3 mg/kg
Second dose reduction	2.4 mg/kg
Requirement for further dose reduction	Discontinue treatment

Table 2 Dose modification guidelines

Dose modifications for patients with EBC		
Adverse reaction	Severity	Treatment modification
Thrombocytopenia	Grade 2-3 on day of scheduled treatment (25 000 to < 75 000/mm ³)	Do not administer trastuzumab emtansine until platelet count recovers to ≤ Grade 1 (≥ 75 000/mm ³), and then treat at the same dose level. If a patient requires 2 delays due to thrombocytopenia, consider reducing dose by one level.
	Grade 4 at any time < 25 000/mm ³	Do not administer trastuzumab emtansine until platelet count recovers to ≤ Grade 1 (≥ 75 000/mm ³), and then reduce one dose level.
Increased Alanine Transaminase (ALT)	Grade 2-3 (> 3.0 to ≤ 20× ULN on day of scheduled treatment)	Do not administer trastuzumab emtansine until ALT recovers to Grade ≤ 1, and then reduce one dose level
	Grade 4 (> 20 × ULN at any time)	Discontinue trastuzumab emtansine
Increased Aspartate Transaminase (AST)	Grade 2 (> 3.0 to ≤ 5× ULN on day of scheduled treatment)	Do not administer trastuzumab emtansine until AST recovers to Grade ≤ 1, and then treat at the same dose level
	Grade 3 (> 5 to ≤ 20× ULN on day of scheduled treatment)	Do not administer trastuzumab emtansine until AST recovers to Grade ≤ 1, and then reduce one dose level
	Grade 4 (> 20 × ULN at any time)	Discontinue trastuzumab emtansine
Hyperbilirubinaemia	TBILI > 1.0 to ≤ 2.0× the ULN on day of scheduled treatment	Do not administer trastuzumab emtansine until total bilirubin recovers to ≤ 1.0× ULN, and then reduce one dose level
	TBILI > 2× ULN at any time	Discontinue trastuzumab emtansine
Drug Induced Liver Injury (DILI)	Serum transaminases > 3 x ULN and concomitant total bilirubin > 2× ULN	Permanently discontinue trastuzumab emtansine in the absence of another likely cause for the elevation of liver enzymes and bilirubin, e.g. liver metastasis or concomitant medication
Nodular Regenerative Hyperplasia (NRH)	All Grades	Permanently discontinue trastuzumab emtansine
Peripheral Neuropathy	Grade 3-4	Do not administer trastuzumab emtansine until resolution ≤ Grade 2

Left Ventricular Dysfunction	LVEF < 45%	Do not administer trastuzumab emtansine . Repeat LVEF assessment within 3 weeks. If LVEF < 45% is confirmed, discontinue trastuzumab emtansine.
	LVEF 45% to < 50% and decrease is ≥ 10% points from baseline*	Do not administer trastuzumab emtansine. Repeat LVEF assessment within 3 weeks. If the LVEF remains < 50% and has not recovered to < 10% points from baseline, discontinue trastuzumab emtansine.
	LVEF 45% to < 50% and decrease is < 10% points from baseline*	Continue treatment with trastuzumab emtansine. Repeat LVEF assessment within 3 weeks.
	LVEF ≥ 50%	Continue treatment with trastuzumab emtansine
Heart Failure	Symptomatic CHF, Grade 3-4 LVSD or Grade 3-4 heart failure, or Grade 2 heart failure accompanied by LVEF <45%	Discontinue trastuzumab emtansine
Pulmonary Toxicity	Interstitial lung disease (ILD) or pneumonitis	Permanently discontinue trastuzumab emtansine
Radiotherapy-Related Pneumonitis	Grade 2	Discontinue trastuzumab emtansine if not resolving with standard treatment
	Grade 3-4	Discontinue trastuzumab emtansine
Dose modifications for patients with MBC		
Adverse reaction	Severity	Treatment modification
Thrombocytopenia	Grade 3 (25 000 to < 50 000/mm ³)	Do not administer trastuzumab emtansine until platelet count recovers to ≤ Grade 1 (≥ 75 000/mm ³), and then treat at the same dose level
	Grade 4 (< 25 000/mm ³)	Do not administer trastuzumab emtansine until platelet count recovers to ≤ Grade 1 (≥ 75 000/mm ³), and then reduce one dose level
Increased Transaminase (AST/ALT)	Grade 2 (> 2.5 to ≤ 5× the ULN)	Treat at the same dose level
	Grade 3 (> 5 to ≤ 20× the ULN)	Do not administer trastuzumab emtansine until AST/ALT recovers to Grade ≤ 2, and then reduce one dose level
	Grade 4 (> 20× the ULN)	Discontinue trastuzumab emtansine

Hyperbilirubinaemia	Grade 2 (> 1.5 to $\leq 3 \times$ the ULN)	Do not administer trastuzumab emtansine until total bilirubin recovers to Grade ≤ 1 , and then treat at the same dose level.
	Grade 3 (> 3 to $\leq 10 \times$ the ULN)	Do not administer trastuzumab emtansine until total bilirubin recovers to Grade ≤ 1 and then reduce one dose level.
	Grade 4 ($> 10 \times$ the ULN)	Discontinue trastuzumab emtansine
Drug Induced Liver Injury (DILI)	Serum transaminases $> 3 \times$ ULN and concomitant total bilirubin $> 2 \times$ ULN	Permanently discontinue trastuzumab emtansine in the absence of another likely cause for the elevation of liver enzymes and bilirubin, e.g. liver metastasis or concomitant medication
Nodular Regenerative Hyperplasia (NRH)	All Grades	Permanently discontinue trastuzumab emtansine
Left Ventricular Dysfunction	Symptomatic CHF	Discontinue trastuzumab emtansine
	LVEF $< 40\%$	Do not administer trastuzumab emtansine. Repeat LVEF assessment within 3 weeks. If LVEF $< 40\%$ is confirmed, discontinue trastuzumab emtansine
	LVEF 40% to $\leq 45\%$ and decrease is $\geq 10\%$ points from baseline	Do not administer trastuzumab emtansine. Repeat LVEF assessment within 3 weeks. If the LVEF has not recovered to within 10% points from baseline, discontinue trastuzumab emtansine.
	LVEF 40% to $\leq 45\%$ and decrease is $< 10\%$ points from baseline	Continue treatment with trastuzumab emtansine. Repeat LVEF assessment within 3 weeks.
	LVEF $> 45\%$	Continue treatment with trastuzumab emtansine.
Peripheral Neuropathy	Grade 3-4	Do not administer trastuzumab emtansine until resolution \leq Grade 2
Pulmonary Toxicity	Interstitial lung disease (ILD) or pneumonitis	Permanently discontinue trastuzumab emtansine

ALT = alanine transaminase; AST = aspartate transaminase, CHF = congestive heart failure, LVEF = left ventricular ejection fraction, LVSD = left ventricular systolic dysfunction, TBILI = Total Bilirubin, ULN = upper limit of normal

* Prior to starting trastuzumab emtansine treatment.

Delayed or missed dose

If a planned dose is missed, it should be administered as soon as possible; without waiting until the next planned cycle. The schedule of administration should be adjusted to maintain a 3-week interval between doses. The next dose should be administered in accordance with the dosing recommendations above.

Peripheral neuropathy

Trastuzumab emtansine should be temporarily discontinued in patients experiencing Grade 3 or 4 peripheral neuropathy until resolution to \leq Grade 2. At retreatment a dose reduction may be considered according to the dose reduction schedule (see Table 1).

Special populations

Elderly patients

No dose adjustment is required in patients aged ≥ 65 years. There are insufficient data to establish the safety and efficacy in patients ≥ 75 years due to limited data in this subgroup. However, for patients ≥ 65 years, subgroup analysis of 345 patients from study MO28231 shows a tendency of higher

incidences of Grade 3, 4 and 5 AE's, SAE's and AE's leading to treatment discontinuation/interruption, but with a similar incidence of AEs of Grade 3 and above classified as treatment related.

Population pharmacokinetic analysis indicates that age does not have a clinically meaningful effect on the pharmacokinetics of trastuzumab emtansine (see sections 5.1 and 5.2).

Renal impairment

No adjustment to the starting dose is needed in patients with mild or moderate renal impairment (see section 5.2). The potential need for dose adjustment in patients with severe renal impairment cannot be determined due to insufficient data and therefore patients with severe renal impairment should be monitored carefully.

Hepatic impairment

No adjustment to the starting dose is required for patients with mild or moderate hepatic impairment. Trastuzumab emtansine has not been studied in patients with severe hepatic impairment. Treatment of patients with hepatic impairment should be undertaken with caution due to known hepatotoxicity observed with trastuzumab emtansine (see section 4.4 and 5.2).

Paediatric population

The safety and efficacy in children and adolescents below 18 years of age have not been established as there is no relevant use in the paediatric population for the indication of breast cancer.

Method of administration

Kadcyla is for intravenous use. Trastuzumab emtansine must be reconstituted and diluted by a healthcare professional and administered as an intravenous infusion. It must not be administered as an intravenous push or bolus.

For instructions on reconstitution and dilution of the medicinal product before administration, see section 6.6.

4.3 Contraindications

Hypersensitivity to the active substance or to any of the excipients listed in section 6.1.

4.4 Special warnings and precautions for use

Traceability

In order to improve traceability of biological medicinal products, the name and the batch number of the administered product should be clearly recorded.

In order to prevent medicinal product errors it is important to check the vial labels to ensure that the medicinal product being prepared and administered is Kadcyla (trastuzumab emtansine) and not another trastuzumab-containing product (e.g. trastuzumab or trastuzumab deruxtecan).

Thrombocytopenia

Thrombocytopenia, or decreased platelet counts, was commonly reported with trastuzumab emtansine and was the most common adverse reaction leading to treatment discontinuation, dose reduction, and dose interruption (see section 4.8). In clinical studies, the incidence and severity of thrombocytopenia were higher in Asian patients (see section 4.8).

It is recommended that platelet counts are monitored prior to each trastuzumab emtansine dose. Patients with thrombocytopenia ($\leq 100\ 000/\text{mm}^3$) and patients on anticoagulant treatment (e.g. warfarin, heparin, low molecular weight heparins) should be monitored closely while on trastuzumab emtansine treatment. Trastuzumab emtansine has not been studied in patients with platelet counts

$\leq 100\,000/\text{mm}^3$ prior to initiation of treatment. In the event of decreased platelet count to Grade 3 or greater ($< 50\,000/\text{mm}^3$), do not administer trastuzumab emtansine until platelet counts recover to Grade 1 ($\geq 75\,000/\text{mm}^3$) (see section 4.2).

Haemorrhage

Cases of haemorrhagic events, including central nervous system, respiratory and gastrointestinal haemorrhage, have been reported with trastuzumab emtansine treatment. Some of these bleeding events resulted in fatal outcomes. In some of the observed cases the patients had thrombocytopenia, or were also receiving anti-coagulant therapy or antiplatelet therapy; in others there were no known additional risk factors. Use caution with these agents and consider additional monitoring when concomitant use is medically necessary.

Hepatotoxicity

Hepatotoxicity, predominantly in the form of asymptomatic increases in the concentrations of serum transaminases (Grade 1-4 transaminitis), has been observed during treatment with trastuzumab emtansine in clinical studies (see section 4.8). Transaminase elevations were generally transient with peak elevation at day 8 after administration of therapy and subsequent recovery to Grade 1 or less prior to the next cycle. A cumulative effect on transaminases has also been observed (the proportion of patients with Grade 1-2 ALT/AST abnormalities increases with successive cycles).

Patients with elevated transaminases improved to Grade 1 or normal within 30 days of the last dose of trastuzumab emtansine in the majority of the cases (see section 4.8).

Serious hepatobiliary disorders, including nodular regenerative hyperplasia (NRH) of the liver and some with a fatal outcome due to drug-induced liver injury have been observed in patients treated with trastuzumab emtansine. Observed cases may have been confounded by comorbidities and/or concomitant medicinal products with known hepatotoxic potential.

Liver function should be monitored prior to initiation of treatment and each dose. Patients with baseline elevation of ALT (e.g. due to liver metastases) may be predisposed to liver injury with a higher risk of a Grade 3-5 hepatic event or liver function test increase. Dose reductions or discontinuation for increased serum transaminases and total bilirubin are specified in section 4.2.

Cases of nodular regenerative hyperplasia (NRH) of the liver have been identified from liver biopsies in patients treated with trastuzumab emtansine. NRH is a rare liver condition characterised by widespread benign transformation of hepatic parenchyma into small regenerative nodules; NRH may lead to non-cirrhotic portal hypertension. Diagnosis of NRH can be confirmed only by histopathology. NRH should be considered in all patients with clinical symptoms of portal hypertension and/or cirrhosis-like pattern seen on the computed tomography (CT) scan of the liver but with normal transaminases and no other manifestations of cirrhosis. Upon diagnosis of NRH, trastuzumab emtansine treatment must be permanently discontinued.

Trastuzumab emtansine has not been studied in patients with serum transaminases $> 2.5 \times \text{ULN}$ or total bilirubin $> 1.5 \times \text{ULN}$ prior to initiation of treatment. Treatment in patients with serum transaminases $> 3 \times \text{ULN}$ and concomitant total bilirubin $> 2 \times \text{ULN}$ should be permanently discontinued. Treatment of patients with hepatic impairment should be undertaken with caution (see sections 4.2 and 5.2).

Neurotoxicity

Peripheral neuropathy, mainly Grade 1 and predominantly sensory, has been reported in clinical studies with trastuzumab emtansine. MBC patients with Grade ≥ 3 and EBC patients with Grade ≥ 2 peripheral neuropathy at baseline were excluded from clinical studies. Treatment with trastuzumab emtansine should be temporarily discontinued in patients experiencing Grade 3 or 4 peripheral neuropathy until symptoms resolve or improve to \leq Grade 2. Patients should be clinically monitored on an ongoing basis for signs/symptoms of neurotoxicity.

Left ventricular dysfunction

Patients treated with trastuzumab emtansine are at increased risk of developing left ventricular dysfunction. Left ventricular ejection fraction (LVEF) < 40% has been observed in patients treated with trastuzumab emtansine, and therefore symptomatic congestive heart failure (CHF) is a potential risk (see section 4.8). General risk factors for a cardiac event and those identified in adjuvant breast cancer studies with trastuzumab therapy include advancing age (> 50 years), low baseline LVEF values (< 55%), low LVEF levels prior to or following the use of paclitaxel in the adjuvant setting, prior or concomitant use of antihypertensive medicinal products, previous therapy with an anthracycline and high BMI (> 25 kg/m²).

Standard cardiac function testing (echocardiogram or multigated acquisition (MUGA) scanning) should be performed prior to initiation of treatment and also at regular intervals (e.g. every three months) during treatment. The dosing should be delayed, or treatment discontinued as necessary in cases of left ventricular dysfunction (see section 4.2). In clinical studies, patients had a LVEF ≥ 50% at baseline. Patients with a history of congestive heart failure (CHF), serious cardiac arrhythmia requiring treatment, history of myocardial infarction or unstable angina within 6 months of randomisation, or current dyspnoea at rest due to advanced malignancy were excluded from clinical studies. Events of LVEF drop of > 10% from baseline and/or CHF were observed in an observational study (BO39807) of MBC patients with baseline LVEF of 40-49% in a real world setting. The decision to administer trastuzumab emtansine in MBC patients with low LVEF must be made only after careful benefit risk assessment and cardiac function should be closely monitored in these patients (see section 4.8).

Pulmonary toxicity

Cases of interstitial lung disease (ILD), including pneumonitis, some leading to acute respiratory distress syndrome or a fatal outcome, have been reported in clinical studies with trastuzumab emtansine (see section 4.8). Signs and symptoms include dyspnoea, cough, fatigue, and pulmonary infiltrates.

It is recommended that treatment with trastuzumab emtansine be permanently discontinued in patients who are diagnosed with ILD or pneumonitis, except for radiation pneumonitis in the adjuvant setting, where trastuzumab emtansine should be permanently discontinued for ≥ Grade 3 or for Grade 2 not responding to standard treatment (see section 4.2).

Patients with dyspnoea at rest due to complications of advanced malignancy, co-morbidities, and receiving concurrent pulmonary radiation therapy may be at increased risk of pulmonary events.

Infusion-related reactions

Trastuzumab emtansine treatment has not been studied in patients who had trastuzumab permanently discontinued due to infusion-related reactions (IRR); treatment is not recommended for these patients. Patients should be observed closely for infusion-related reactions, especially during the first infusion.

Infusion-related reactions (due to cytokine release), characterised by one or more of the following symptoms have been reported: flushing, chills, pyrexia, dyspnoea, hypotension, wheezing, bronchospasm, and tachycardia. In general, these symptoms were not severe (see section 4.8). In most patients, these reactions resolved over the course of several hours to a day after the infusion was terminated. Treatment should be interrupted in patients with a severe IRR until signs and symptoms resolve. Consideration for re-treatment should be based on clinical assessment of the severity of the reaction. Treatment must be permanently discontinued in the event of a life threatening infusion-related reaction (see section 4.2).

Hypersensitivity reactions

Trastuzumab emtansine treatment has not been studied in patients who had trastuzumab permanently discontinued due to hypersensitivity; treatment with trastuzumab emtansine is not recommended for these patients.

Patients should be observed closely for hypersensitivity/allergic reactions, which may have the same clinical presentation as an IRR. Serious, anaphylactic reactions have been observed in clinical studies with trastuzumab emtansine. Medicinal products to treat such reactions, as well as emergency equipment, should be available for immediate use. In the event of a true hypersensitivity reaction (in which severity of reaction increases with subsequent infusions), trastuzumab emtansine treatment must be permanently discontinued.

Injection-site reactions

Extravasation of trastuzumab emtansine during intravenous injection may produce local pain. Exceptionally, cases of severe tissue lesions and epidermal necrosis may occur. If extravasation occurs, the infusion should be terminated immediately and the patient should be examined regularly as necrosis may occur within days to weeks after infusion.

Excipients with known effect

This medicine contains 1.1 mg of polysorbate 20 in each 100 mg vial and 1.7 mg of polysorbate 20 in each 160 mg vial. Polysorbates may cause allergic reactions.

This medicinal product contains less than 1 mmol sodium (23 mg) per dose, i.e. essentially 'sodium-free'.

4.5 Interaction with other medicinal products and other forms of interaction

No formal interaction studies have been performed.

In vitro metabolism studies in human liver microsomes suggest that DM1, a component of trastuzumab emtansine, is metabolised mainly by CYP3A4 and, to a lesser extent, by CYP3A5. Concomitant use of strong CYP3A4 inhibitors (e.g., ketoconazole, itraconazole, clarithromycin, atazanavir, indinavir, nefazodone, nelfinavir, ritonavir, saquinavir, telithromycin, and voriconazole) with trastuzumab emtansine should be avoided due to the potential for an increase in DM1 exposure and toxicity. Consider an alternate medicinal product with no or minimal potential to inhibit CYP3A4. If concomitant use of strong CYP3A4 inhibitors is unavoidable, consider delaying trastuzumab emtansine treatment until the strong CYP3A4 inhibitors have cleared from the circulation (approximately 3 elimination half-lives of the inhibitors) when possible. If a strong CYP3A4 inhibitor is co-administered and trastuzumab emtansine treatment cannot be delayed, patients should be closely monitored for adverse reactions.

4.6 Fertility, pregnancy and lactation

Contraception in males and females

Women of childbearing potential should use effective contraception while receiving trastuzumab emtansine and for 7 months following the last dose of trastuzumab emtansine. Male patients or their female partners should also use effective contraception.

Pregnancy

There are no data from the use of trastuzumab emtansine in pregnant women. Trastuzumab, a component of trastuzumab emtansine, can cause foetal harm or death when administered to a pregnant woman. In the post-marketing setting, cases of oligohydramnios, some associated with fatal pulmonary hypoplasia, have been reported in pregnant women receiving trastuzumab. Animal studies of maytansine, a closely related chemical entity of the same maytansinoid class as DM1, suggest that DM1, the microtubule inhibiting cytotoxic component of trastuzumab emtansine, is expected to be teratogenic and potentially embryotoxic (see section 5.3).

Administration of trastuzumab emtansine to pregnant women is not recommended and women should be informed of the possibility of harm to the foetus before they become pregnant. Women who

become pregnant must immediately contact their doctor. If a pregnant woman is treated with trastuzumab emtansine, close monitoring by a multidisciplinary team is recommended.

Breast-feeding

It is not known whether trastuzumab emtansine is excreted in human milk. Since many medicinal products are excreted in human milk and because of the potential for serious adverse reactions in breast-feeding infants, women should discontinue breast-feeding prior to initiating treatment with trastuzumab emtansine. Women may begin breast-feeding 7 months after concluding treatment.

Fertility

No reproductive and developmental toxicology studies have been conducted with trastuzumab emtansine.

4.7 Effects on ability to drive and use machines

Trastuzumab emtansine has minor influence on the ability to drive and use machines. The significance of reported adverse reactions such as fatigue, headache, dizziness and blurred vision on the ability to drive or use machines is unknown. Patients experiencing infusion-related reactions (flushing, chills, pyrexia, dyspnoea, hypotension, wheezing, bronchospasm, and tachycardia) should be advised not to drive and use machines until symptoms abate.

4.8 Undesirable effects

Summary of the safety profile

The safety of trastuzumab emtansine has been evaluated in 2 611 breast cancer patients in clinical studies. In this patient population:

- the most common serious adverse drug reactions (ADRs) (> 0.5% of patients) were haemorrhage, pyrexia, thrombocytopenia, dyspnoea, abdominal pain, musculoskeletal pain, and vomiting.
- the most common ADRs ($\geq 25\%$) with trastuzumab emtansine were nausea, fatigue, musculoskeletal pain, haemorrhage, headache, transaminases increased, thrombocytopenia, and peripheral neuropathy. The majority of ADRs reported were of Grade 1 or 2 severity.
- the most common National Cancer Institute - Common Terminology Criteria for Adverse Events (NCI-CTCAE) Grade ≥ 3 ADRs (> 2%) were thrombocytopenia, increased transaminases, anaemia, neutropenia, fatigue and hypokalaemia.

Tabulated list of adverse reactions

The ADRs in 2 611 patients treated with trastuzumab emtansine are presented in Table 3. The ADRs are listed below by MedDRA system organ class (SOC) and categories of frequency. Frequency categories are defined as very common ($\geq 1/10$), common ($\geq 1/100$ to $< 1/10$), uncommon ($\geq 1/1\ 000$ to $< 1/100$), rare ($\geq 1/10\ 000$ to $< 1/1\ 000$), very rare ($< 1/10\ 000$) and not known (cannot be estimated from the available data). Within each frequency grouping and SOC, adverse reactions are presented in order of decreasing seriousness. ADRs were reported using NCI-CTCAE for assessment of toxicity.

Table 3 Tabulated list of ADRs in patients treated with trastuzumab emtansine in clinical studies

System Organ Class	Frequency	Adverse reactions
Infections and infestations	Very common	Urinary tract infection
Blood and lymphatic system disorders	Very common	Thrombocytopenia, Anaemia
	Common	Neutropenia, Leukopenia
Immune system disorders	Common	Drug hypersensitivity
Metabolism and nutrition disorders	Common	Hypokalaemia
Psychiatric disorders	Very common	Insomnia
Nervous system disorders	Very common	Neuropathy peripheral, Headache
	Common	Dizziness, Dysgeusia, Memory impairment
Eye disorders	Common	Dry eye, Conjunctivitis, Vision blurred, Lacrimation increased
Cardiac disorders	Common	Left ventricular dysfunction
Vascular disorders	Very common	Haemorrhage
	Common	Hypertension
Respiratory, thoracic and mediastinal disorders	Very common	Epistaxis, Cough, Dyspnoea
	Uncommon	Pneumonitis (ILD)
Gastrointestinal disorders	Very common	Stomatitis, Diarrhoea, Vomiting, Nausea, Constipation, Dry mouth, Abdominal pain
	Common	Dyspepsia, Gingival bleeding
Hepatobiliary disorders	Very common	Transaminases increased
	Common	Blood alkaline phosphatase increased, Blood bilirubin increased
	Uncommon	Hepatotoxicity, Nodular regenerative hyperplasia, Portal hypertension
	Rare	Hepatic failure
Skin and subcutaneous tissue disorders	Common	Rash, Pruritus, Alopecia, Nail disorder, Palmar-plantar erythrodysesthesia syndrome, Urticaria
Musculoskeletal and connective tissue disorders	Very common	Musculoskeletal pain, Arthralgia, Myalgia
General disorders and administration site conditions	Very common	Fatigue, Pyrexia, Asthenia
	Common	Peripheral oedema, Chills
	Uncommon	Injection site extravasation
Injury, poisoning and procedural complications	Common	Infusion related reactions
	Uncommon	Radiation pneumonitis

Table 3 shows pooled data from the overall treatment period in the MBC studies (N = 1871; median number of cycles of trastuzumab emtansine was 10) and in KATHERINE (N = 740; median number of cycles was 14).

Description of selected adverse reactions

Thrombocytopenia

Thrombocytopenia or decreased platelet counts were reported in 24.9% of patients in MBC clinical studies with trastuzumab emtansine and was the most common adverse reaction leading to treatment discontinuation (2.6%). Thrombocytopenia was reported in 28.6% of patients in EBC clinical studies with trastuzumab emtansine and was the most common reported adverse reaction for all grades and grades ≥ 3 , as well as the most common adverse reaction leading to treatment discontinuation (4.2%), dose interruptions, and dose reductions. The majority of the patients had Grade 1 or 2 events ($\geq 50\ 000/\text{mm}^3$), with the nadir occurring by day 8 and generally improving to Grade 0 or 1 ($\geq 75\ 000/\text{mm}^3$) by the next scheduled dose. In clinical studies, the incidence and severity of thrombocytopenia were higher in Asian patients. Independent of race, the incidence of Grade 3 or 4 events ($< 50\ 000/\text{mm}^3$) was 8.7% in patients with MBC treated with trastuzumab emtansine and 5.7% in patients with EBC. For dose modifications for thrombocytopenia, see sections 4.2 and 4.4.

Haemorrhage

Haemorrhagic events were reported in 34.8% of patients in MBC clinical studies with trastuzumab emtansine and the incidence of severe haemorrhagic events (Grade ≥ 3) occurred in 2.2%. Haemorrhagic events were reported in 29.2% of patients with EBC and the incidence of severe haemorrhagic events (Grade ≥ 3) was 0.4%, including one Grade 5 event. In some of the observed cases the patients had thrombocytopenia, or were also receiving anti-coagulant therapy or antiplatelet therapy; in others there were no known additional risk factors. Cases of bleeding events with a fatal outcome have been observed in both MBC and EBC.

Transaminases increased (AST/ALT)

Increase in serum transaminases (Grade 1-4) has been observed during treatment with trastuzumab emtansine in clinical studies (see section 4.4). Transaminase elevations were generally transient. A cumulative effect of trastuzumab emtansine on transaminases has been observed, and generally recovered when treatment was discontinued. Increased transaminases were reported in 24.2% of patients in MBC clinical studies. Grade 3 or 4 increased AST and ALT were reported in 4.2% and 2.7% of patients with MBC respectively and usually occurred in the early treatment cycles (1-6). Increased transaminases were reported in 32.6% of patients with EBC. Grade 3 and 4 increased transaminases were reported in 1.6% of patients with EBC. In general, the Grade ≥ 3 hepatic events were not associated with poor clinical outcome; subsequent follow up values tended to show improvement to ranges allowing the patient to remain on study and continue to receive study treatment at the same or reduced dose. No relationship was observed between trastuzumab emtansine exposure (AUC), trastuzumab emtansine maximum serum concentration (C_{max}), total trastuzumab exposure (AUC), or C_{max} of DM1 and increases in transaminase. For dose modifications in the event of increased transaminases, see sections 4.2 and 4.4.

Left ventricular dysfunction

Left ventricular dysfunction was reported in 2.2% of patients in MBC clinical studies with trastuzumab emtansine. The majority of events were asymptomatic Grade 1 or 2 decrease in LVEF. Grade 3 or 4 events were reported in 0.4% of patients with MBC. In an observational study (BO39807), approximately 22% (7 out of 32) of MBC patients initiating trastuzumab emtansine with LVEF of 40-49% at baseline, experienced a LVEF drop of $> 10\%$ from baseline and/or CHF; most of these patients had other cardiovascular risk factors. Left ventricular dysfunction occurred in 3.0% of patients with EBC, with Grade 3 in 0.5% of patients, and no events of higher grade. For dose modifications in the event of LVEF decrease, see Table 2 in section 4.2 and section 4.4.

Peripheral neuropathy

Peripheral neuropathy, mainly as Grade 1 and predominantly sensory, was reported in clinical studies of trastuzumab emtansine. In patients with MBC, the overall incidence of peripheral neuropathy was 29.0% and 8.6% for Grade ≥ 2 . In patients with EBC, the overall incidence was 32.0% and 10.1% for Grade ≥ 2 .

Infusion-related reactions

Infusion-related reactions are characterised by one or more of the following symptoms: flushing, chills, pyrexia, dyspnoea, hypotension, wheezing, bronchospasm and tachycardia. Infusion-related reactions were reported in 4.0% of patients in MBC clinical studies with trastuzumab emtansine, with six Grade 3 and no Grade 4 events reported. Infusion-related reactions were reported in 1.6% of patients with EBC, with no Grade 3 or 4 events reported. Infusion-related reactions resolved over the course of several hours to a day after the infusion was terminated. No dose relationship was observed in clinical studies. For dose modifications in the event of infusion-related reactions, see sections 4.2 and 4.4.

Hypersensitivity reactions

Hypersensitivity was reported in 2.6% of patients in MBC clinical studies with trastuzumab emtansine, with one Grade 3 and one Grade 4 events reported. Hypersensitivity was reported in 2.7% of patients with EBC, with Grade 3 in 0.4% of patients and no events of higher grade. Overall, the majority of hypersensitivity reactions were mild or moderate in severity and resolved upon treatment. For dose modifications in the event of hypersensitivity reactions, see sections 4.2 and 4.4.

Immunogenicity

As with all therapeutic proteins, there is the potential for an immune response to trastuzumab emtansine. A total of 1 243 patients from seven clinical studies were tested at multiple time points for anti-drug antibody (ADA) responses to trastuzumab emtansine. Following trastuzumab emtansine dosing, 5.1% (64/1 243) of patients tested positive for anti-trastuzumab emtansine antibodies at one or more post-dose time points. In the Phase I and Phase II studies, 6.4% (24/376) of patients tested positive for anti-trastuzumab emtansine antibodies. In the EMILIA study (TDM4370g/BO21977), 5.2% (24/466) of patients tested positive for anti-trastuzumab emtansine antibodies, of which 13 were also positive for neutralising antibodies. In the KATHERINE (BO27938) study, 4.0% (16/401) of patients tested positive for anti-trastuzumab emtansine antibodies, of which 5 were also positive for neutralizing antibodies. Due to the low occurrence of anti-drug antibodies, the effect of these antibodies on the pharmacokinetics, pharmacodynamics, safety, and/or effectiveness of trastuzumab emtansine is unknown.

Extravasation

Reactions secondary to extravasation have been observed in clinical studies with trastuzumab emtansine. These reactions were usually mild or moderate and comprised erythema, tenderness, skin irritation, pain, or swelling at the infusion site. These reactions have been observed more frequently within 24 hours of infusion. In the post-marketing setting, cases of epidermal injury or necrosis following extravasation have been exceptionally observed within days to weeks after infusion. Specific treatment for trastuzumab emtansine extravasation is unknown at this time (see section 4.4).

Laboratory abnormalities

Tables 4 and 5 displays laboratory abnormalities observed in patients treated with trastuzumab emtansine in clinical study TDM4370g/BO21977/EMILIA and study BO27938/KATHERINE.

Table 4 Laboratory abnormalities observed in patients treated with trastuzumab emtansine in study TDM4370g/BO21977/EMILIA

Parameter	Trastuzumab emtansine (N = 490)		
	All Grades (%)	Grade 3 (%)	Grade 4 (%)
Hepatic			
Increased bilirubin	21	< 1	0
Increased AST	98	8	< 1
Increased ALT	82	5	< 1

Haematologic			
Decreased platelet count	85	14	3
Decreased haemoglobin	63	5	1
Decreased neutrophils	41	4	< 1
Potassium			
Decreased potassium	35	3	< 1

Table 5 Laboratory abnormalities observed in patients treated with trastuzumab emtansine in study BO27938/KATHERINE

Parameter	Trastuzumab emtansine (N = 740)		
	All Grade %	Grade 3 (%)	Grade 4 (%)
Hepatic			
Increased bilirubin	11	0	0
Increased AST	79	< 1	0
Increased ALT	55	< 1	0
Haematologic			
Decreased platelet count	51	4	2
Decreased haemoglobin	31	1	0
Decreased neutrophils	24	1	0
Potassium			
Decreased potassium	26	2	< 1

Reporting of suspected adverse reactions

Reporting suspected adverse reactions after authorisation of the medicinal product is important. It allows continued monitoring of the benefit/risk balance of the medicinal product. Healthcare professionals are asked to report any suspected adverse reactions via [the national reporting system](#) listed in [Appendix V](#).

4.9 Overdose

There is no known antidote for trastuzumab emtansine overdose. In case of overdose, the patient should be closely monitored for signs or symptoms of adverse reactions and appropriate symptomatic treatment instituted. Cases of overdose have been reported with trastuzumab emtansine treatment, most associated with thrombocytopenia, and there was one death. In the fatal case, the patient incorrectly received trastuzumab emtansine 6 mg/kg and died approximately 3 weeks following the overdose; a causal relationship to trastuzumab emtansine was not established.

5. PHARMACOLOGICAL PROPERTIES

5.1 Pharmacodynamic properties

Pharmacotherapeutic group: Antineoplastic and immunomodulating agents, antineoplastic agents, monoclonal antibodies and antibody drug conjugates, HER2 inhibitors, ATC code: L01FD03

Mechanism of action

Kadcyla, trastuzumab emtansine, is a HER2-targeted antibody-drug conjugate which contains the humanised anti-HER2 IgG1, trastuzumab, covalently linked to the microtubule inhibitor DM1 (a maytansine derivative) via the stable thioether linker MCC (4-[N-maleimidomethyl] cyclohexane-1-carboxylate). Emtansine refers to the MCC-DM1 complex. An average of 3.5 DM1 molecules are conjugated to each molecule of trastuzumab.

Conjugation of DM1 to trastuzumab confers selectivity of the cytotoxic agent for HER2-overexpressing tumour cells, thereby increasing intracellular delivery of DM1 directly to malignant cells. Upon binding to HER2, trastuzumab emtansine undergoes receptor-mediated internalisation and subsequent lysosomal degradation, resulting in release of DM1-containing cytotoxic catabolites (primarily lysine-MCC-DM1).

Trastuzumab emtansine has the mechanisms of action of both trastuzumab and DM1:

- Trastuzumab emtansine, like trastuzumab, binds to domain IV of the HER2 extracellular domain (ECD), as well as to Fcγ receptors and complement C1q. In addition, trastuzumab emtansine, like trastuzumab, inhibits shedding of the HER2 ECD, inhibits signalling through the phosphatidylinositol 3-kinase (PI3-K) pathway, and mediates antibody-dependent cell-mediated cytotoxicity (ADCC) in human breast cancer cells that overexpress HER2.
- DM1, the cytotoxic component of trastuzumab emtansine, binds to tubulin. By inhibiting tubulin polymerisation, both DM1 and trastuzumab emtansine cause cells to arrest in the G2/M phase of the cell cycle, ultimately leading to apoptotic cell death. Results from *in vitro* cytotoxicity assays show that DM1 is 20-200 times more potent than taxanes and vinca alkaloids.
- The MCC linker is designed to limit systemic release and increase targeted delivery of DM1, as demonstrated by detection of very low levels of free DM1 in plasma.

Clinical efficacy

Early Breast Cancer

BO27938 (KATHERINE)

BO27938 (KATHERINE) was a randomised, multicentre, open-label trial of 1486 patients with HER2-positive, early breast cancer with residual invasive tumour (patients who had not achieved pathological complete response (pCR)) in the breast and/or axillary lymph nodes following completion of preoperative systemic therapy that included chemotherapy and HER2-targeted therapy. Patients may have received more than one HER2-targeted therapy. Patients received radiotherapy and/or hormonal therapy concurrent with study treatment as per local guidelines. Breast tumour samples were required to show HER2 overexpression defined as 3+ IHC or ISH amplification ratio ≥ 2.0 determined at a central laboratory. Patients were randomised (1:1) to receive trastuzumab or trastuzumab emtansine. Randomisation was stratified by clinical stage at presentation (operable vs. inoperable), hormone receptor status, preoperative HER2-directed therapy (trastuzumab, trastuzumab plus additional HER2-directed agent[s]), and pathological nodal status evaluated after preoperative therapy.

Trastuzumab emtansine was given intravenously at 3.6 mg/kg on Day 1 of a 21-day cycle. Trastuzumab was given intravenously at 6 mg/kg on Day 1 of a 21-day cycle. Patients were treated with trastuzumab emtansine or trastuzumab for a total of 14 cycles unless there was recurrence of disease, withdrawal of consent, or unacceptable toxicity, whichever occurred first. Patients who discontinued trastuzumab emtansine could complete the duration of their intended study treatment up to 14 cycles of HER2-directed therapy with trastuzumab if appropriate based on toxicity considerations and investigator discretion.

The primary efficacy endpoint of the study was Invasive Disease-Free Survival (IDFS). IDFS was defined as the time from the date of randomisation to first occurrence of ipsilateral invasive breast tumour recurrence, ipsilateral local or regional invasive breast cancer recurrence, distant recurrence, contralateral invasive breast cancer, or death from any cause. Additional endpoints included IDFS including second primary non-breast cancer, disease-free survival (DFS), overall survival (OS), and distant recurrence-free interval (DRFI).

Patient demographics and baseline tumour characteristics were balanced between treatment arms. The median age was approximately 49 years (range 23-80 years), 72.8% were White, 8.7% were Asian and

2.7% were Black or African American. All but 5 patients were women; 3 men were included in the trastuzumab arm and 2 in the trastuzumab emtansine arm. 22.5 percent of patients were enrolled in North America, 54.2% in Europe and 23.3% throughout the rest of the world. Tumour prognostic characteristics including hormone receptor status (positive: 72.3%, negative: 27.7%), clinical stage at presentation (inoperable: 25.3%, operable: 74.8%) and pathological nodal status after preoperative therapy (node positive: 46.4%, node negative or not evaluated: 53.6%) were similar in the study arms.

The majority of the patients (76.9%) had received an anthracycline-containing neoadjuvant chemotherapy regimen. 19.5% percent of patients received another HER2-targeted agent in addition to trastuzumab as a component of neoadjuvant therapy; 93.8% of these patients received pertuzumab. All of the patients had received taxanes as part of neoadjuvant chemotherapy.

At the time of primary analysis, a statistically significant improvement in IDFS was observed in patients who received trastuzumab emtansine compared with trastuzumab, see Table 6.

The final descriptive IDFS analysis was conducted when 385 IDFS events had been observed and showed results which are consistent with the primary analysis (HR = 0.54, 95% CI: 0.44 – 0.66), see Figure 1. The second interim OS analysis was performed after a median follow-up of 101 months and showed a statistically significant improvement in OS in patients who received trastuzumab emtansine compared with trastuzumab (unstratified HR = 0.66, 95% CI: 0.51 – 0.87, $p = 0.0027$). See Table 6 and Figure 2.

Table 6 Summary of efficacy from study BO27938 (KATHERINE)

	Trastuzumab N = 743	Trastuzumab Emtansine N = 743
Primary Endpoint		
Invasive Disease-Free Survival (IDFS) ^{1,3}		
Number (%) of patients with event	165 (22.2%)	91 (12.2%)

p-value (Log-Rank test, unstratified)	< 0.0001	
3 year event-free rate ² ,% [95% CI]	76.9 [73.65, 80.14]	87.7 [85.18, 90.18]
Disease-Free Survival (DFS)^{1,5}		
Number (%) of patients with event	167 (22.5%)	98 (13.2%)
HR [95% CI]	0.53 [0.41, 0.68]	
p-value (Log-Rank test, unstratified)	< 0.0001	
3 year event-free rate ² ,% [95% CI]	76.9 [73.65, 80.14]	87.41 [84.88, 89.93]
Distant recurrence-free interval (DRFI)^{1,5}		
Number (%) of patients with event	121 (16.3%)	78 (10.5%)
HR [95% CI]	0.60 [0.45, 0.79]	
p-value (Log-Rank test, unstratified)	0.0003	
3 year event-free rate ² ,% [95% CI]	83.0 [80.10, 85.92]	89.7 [87.37, 92.01]

Key to abbreviations (Table6): HR: Hazard Ratio; CI: Confidence Intervals,

1. Data from primary analysis
2. 3 year event-free rate and 7 year survival rate derived from Kaplan-Meier estimates
3. Hierarchical testing applied for IDFS and OS
4. Data from second interim OS analysis
5. These secondary endpoints were not adjusted for multiplicity

Figure 1 Kaplan-Meier Curve of Invasive Disease-Free Survival in KATHERINE (Updated Analysis)

Figure 2 Kaplan-Meier Curve of Overall Survival in KATHERINE (Updated Analysis)

In KATHERINE, consistent treatment benefit of trastuzumab emtansine for IDFS was seen in all the pre-specified subgroups evaluated, supporting the overall result.

Metastatic Breast Cancer

TDM4370g/BO21977(EMILIA)

A Phase III, randomised, multicentre, international, open-label clinical study was conducted in patients with HER2-positive unresectable locally advanced breast cancer (LABC) or MBC who had received prior taxane and trastuzumab-based therapy, including patients who received prior therapy with trastuzumab and a taxane in the adjuvant setting and who relapsed during or within six months of completing adjuvant therapy. Only patients with Eastern Cooperative Oncology Group (ECOG) Performance Status 0 or 1 were eligible. Prior to enrolment, breast tumour samples were required to be centrally confirmed for HER2-positive status defined as a score of 3+ by IHC or gene amplification by ISH. Baseline patient and tumour characteristics were well balanced between treatment groups. Patients with treated brain metastases were eligible for enrollment if they did not require therapy to control symptoms. For patients randomised to trastuzumab emtansine, the median age was 53 years, most patients were female (99.8%), the majority were Caucasian (72%), and 57% had oestrogen-receptor and/or progesterone-receptor positive disease. The study compared the safety and efficacy of trastuzumab emtansine with that of lapatinib plus capecitabine. A total of 991 patients were randomised to trastuzumab emtansine or lapatinib plus capecitabine as follows:

- Trastuzumab emtansine arm: trastuzumab emtansine 3.6 mg/kg intravenously over 30-90 minutes on Day 1 of a 21-day cycle
- Control arm (lapatinib plus capecitabine): lapatinib 1250 mg/day orally once per day of a 21-day cycle plus capecitabine 1000 mg/m² orally twice daily on Days 1-14 of a 21-day cycle

The co-primary efficacy endpoints of the study were progression-free survival (PFS) as assessed by an independent review committee (IRC) and overall survival (OS) (see Table 7 and Figures 3 to 4).

Time to symptom progression, as defined by a 5-point decrease in the score derived from the Trials Outcome Index-Breast (TOI-B) subscale of the Functional Assessment of Cancer Therapy-Breast Quality of Life (FACT-B QoL) questionnaire was also assessed during the clinical study. A change of 5 points in the TOI-B is considered clinically significant. Kadcyla delayed patient-reported time to symptom progression for 7.1 months compared with 4.6 months for the control arm (Hazard Ratio 0.796 (0.667, 0.951); p-value 0.0121). The data are from an open-label study and no firm conclusions can be drawn.

Table 7 Summary of efficacy from study TDM4370g/BO21977 (EMILIA)

	Lapatinib + Capecitabine n = 496	Trastuzumab emtansine n = 495
Primary endpoints		
IRC-assessed progression-free survival (PFS)		
Number (%) of patients with event	304 (61.3%)	265 (53.5%)
Median duration of PFS (months)	6.4	9.6
Hazard ratio (stratified*)	0.650	
95% CI for Hazard ratio	(0.549, 0.771)	
p-value (Log-rank test, stratified*)	< 0.0001	
Overall Survival (OS)**		
Number (%) of patients who died	182 (36.7%)	149 (30.1%)
Median duration of survival (months)	25.1	30.9
Hazard ratio (stratified*)	0.682	
95% CI for Hazard ratio	(0.548, 0.849)	
p-value (Log-rank test*)	0.0006	
Key secondary endpoints		
Investigator-assessed PFS		
Number (%) of patients with event	335 (67.5%)	287 (58.0%)
Median duration of PFS (months)	5.8	9.4
Hazard ratio (95% CI)	0.658 (0.560, 0.774)	
p-value (Log-rank test*)	< 0.0001	
Objective response rate (ORR)		
Patients with measurable disease	389	397
Number of patients with OR (%)	120 (30.8%)	173 (43.6%)
Difference (95% CI)	12.7% (6.0, 19.4)	
p-value (Mantel-Haenszel chi-squared test*)	0.0002	
Duration of objective response (months)		
Number of patients with OR	120	173
Median 95% CI	6.5 (5.5, 7.2)	12.6 (8.4, 20.8)

OS: overall survival; PFS: progression-free survival; ORR: objective response rate; OR: objective response; IRC: independent review committee; HR: hazard ratios; CI: confidence interval

* Stratified by: world region (United States, Western Europe, other), number of prior chemotherapeutic regimens for locally advanced or metastatic disease (0-1 vs. > 1), and visceral vs. non-visceral disease.

** The interim analysis for OS was conducted when 331 events were observed. Since the efficacy boundary was crossed at this analysis, this is considered the definitive analysis.

A treatment benefit was seen in the subgroup of patients who had relapsed within 6 months of completing adjuvant treatment and had not received any prior systemic anti-cancer therapy in the metastatic setting (n = 118); hazard ratios for PFS and OS were 0.51 (95% CI: 0.30, 0.85) and 0.61 (95% CI: 0.32, 1.16), respectively. The median PFS and OS for the trastuzumab emtansine group were

10.8 months and not reached, respectively, compared with 5.7 months and 27.9 months, respectively, for the lapatinib plus capecitabine group.

Figure 3 Kaplan-Meier curve of IRC-assessed progression-free survival

T-DM1: trastuzumab emtansine; Lap: lapatinib; Cap: capecitabine; IRC: independent review committee. Hazard ratio is estimated based on a stratified Cox model; p-value is estimated based on a stratified log-rank test.

Figure 4 Kaplan-Meier curve of overall survival

T-DM1: trastuzumab emtansine; Lap: lapatinib; Cap: capecitabine. Hazard ratio is estimated based on a stratified Cox model; p-value is estimated based on a stratified log-rank test.

In study TDM4370g/BO21977, consistent treatment benefit of trastuzumab emtansine was seen in the majority of pre-specified subgroups evaluated, supporting the robustness of the overall result. In the

subgroup of patients with hormone receptor-negative disease (n = 426), the hazard ratios for PFS and OS were 0.56 (95% CI: 0.44, 0.72) and 0.75 (95% CI: 0.54, 1.03), respectively. In the subgroup of patients with hormone receptor-positive disease (n = 545), the hazard ratios for PFS and OS were 0.72 (95% CI: 0.58, 0.91) and 0.62 (95% CI: 0.46, 0.85), respectively.

In the subgroup of patients with non-measurable disease (n = 205), based on IRC assessments, the hazard ratios for PFS and OS were 0.91 (95% CI: 0.59, 1.42) and 0.96 (95% CI: 0.54, 1.68), respectively. In patients \geq 65 years old (n = 138 across both treatment arms) the hazard ratios for progression-free survival (PFS) and Overall Survival (OS) were 1.06 (95% CI: 0.68, 1.66) and 1.05 (95% CI: 0.58, 1.91), respectively. In patients 65 to 74 years old (n = 113), based on IRC assessments, the hazard ratios for PFS and OS were 0.88 (95% CI: 0.53, 1.45) and 0.74 (95% CI: 0.37, 1.47), respectively. For patients 75 years or above, based on IRC assessments, the hazard ratios for PFS and OS were 3.51 (95% CI: 1.22, 10.13) and 3.45 (95% CI: 0.94, 12.65), respectively. The subgroup of patients 75 years or above did not demonstrate a benefit for PFS or OS, but was too small (n = 25) to draw any definitive conclusions.

In the descriptive follow-up overall survival analysis, the hazard ratio was 0.75 (95% CI 0.64, 0.88). The median duration of overall survival was 29.9 months in the trastuzumab emtansine arm compared with 25.9 months in the lapatinib plus capecitabine arm. At the time of the descriptive follow-up overall survival analysis, a total of 27.4% of the patients had crossed over from the lapatinib plus capecitabine arm to the trastuzumab emtansine arm. In a sensitivity analysis censoring patients at the time of cross-over, the hazard ratio was 0.69 (95% CI 0.59, 0.82). The results of this descriptive follow-up analysis are consistent with the confirmatory OS analysis.

TDM4450g

A randomised, multicentre, open-label phase II study evaluated the effects of trastuzumab emtansine versus trastuzumab plus docetaxel in patients with HER2-positive MBC who had not received prior chemotherapy for metastatic disease. Patients were randomised to receive trastuzumab emtansine 3.6 mg/kg intravenously every 3 weeks (n = 67) or trastuzumab 8 mg/kg intravenous loading dose followed by 6 mg/kg intravenously every 3 weeks plus docetaxel 75-100 mg/m² intravenously every 3 weeks (n = 70).

The primary endpoint was investigator assessed Progression-Free Survival (PFS). The median PFS was 9.2 months in the trastuzumab plus docetaxel arm and 14.2 months in the trastuzumab emtansine arm (hazard ratio, 0.59; p = 0.035), with a median follow-up of approximately 14 months in both arms. The objective response rate (ORR) was 58.0% with trastuzumab plus docetaxel and 64.2% with trastuzumab emtansine. The median duration of response was not reached with trastuzumab emtansine vs. 9.5 months in the control arm.

TDM4374g

A Phase II, single-arm, open-label study evaluated the effects of trastuzumab emtansine in patients with HER2-positive incurable, LABC or MBC. All patients were previously treated with HER2-directed therapies (trastuzumab and lapatinib), and chemotherapy (anthracycline, taxane, and capecitabine) in the neoadjuvant, adjuvant, locally advanced, or metastatic setting. The median number of anti-cancer agents that patients had received in any setting was 8.5 (range, 5-19) and in the metastatic setting was 7.0 (range, 3-17), including all agents intended for the treatment of breast cancer.

Patients (n = 110) received 3.6 mg/kg of trastuzumab emtansine intravenously every 3 weeks until disease progression or unacceptable toxicity.

The key efficacy analyses were ORR based on independent radiologic review and duration of objective response. The ORR was 32.7% (95% CI: 24.1, 42.1), n = 36 responders, by both IRC and investigator review. The median duration of response by IRC was not reached (95% CI, 4.6 months to not estimable).

Paediatric population

The European Medicines Agency has waived the obligation to submit the results of studies with trastuzumab emtansine in all subsets of the paediatric population in breast cancer (see section 4.2 for information on paediatric use).

5.2 Pharmacokinetic properties

The population pharmacokinetic analysis suggested no difference in trastuzumab emtansine exposure based on disease status (adjuvant vs. metastatic setting).

Absorption

Trastuzumab emtansine is administered intravenously. There have been no studies performed with other routes of administration.

Distribution

Patients in Study TDM4370g/BO21977 and Study BO29738 who received 3.6 mg/kg of trastuzumab emtansine intravenously every 3 weeks had a mean Cycle 1 maximum serum concentration (C_{max}) of trastuzumab emtansine of 83.4 (\pm 16.5) μ g/mL and 72.6 (\pm 24.3) μ g/mL, respectively. Based on population PK analysis, following intravenous administration, the central volume of distribution of trastuzumab emtansine was (3.13 L) and approximated that of plasma volume.

Biotransformation (trastuzumab emtansine and DM1)

Trastuzumab emtansine is expected to undergo deconjugation and catabolism by means of proteolysis in cellular lysosomes.

In vitro metabolism studies in human liver microsomes suggest that DM1, a small molecule component of trastuzumab emtansine, is metabolised mainly by CYP3A4 and to a lesser extent by CYP3A5. DM1 did not inhibit major CYP450 enzymes *in vitro*. In human plasma, trastuzumab emtansine catabolites MCC-DM1, Lys-MCC-DM1, and DM1 were detected at low levels. *In vitro*, DM1 was a substrate of P-glycoprotein (P-gp).

Elimination

Based on population pharmacokinetic (PK) analysis, following intravenous administration of trastuzumab emtansine in patients with HER2-positive metastatic breast cancer, the clearance of trastuzumab emtansine was 0.68 L/day and the elimination half-life ($t_{1/2}$) was approximately 4 days. No accumulation of trastuzumab emtansine was observed after repeated dosing of intravenous infusion every 3 weeks.

Based on population PK analysis, body weight, albumin, sum of longest diameter of target lesions by Response Evaluation Criteria In Solid Tumours (RECIST), HER2 shed extracellular domain (ECD), baseline trastuzumab concentrations, and aspartate aminotransferase (AST) were identified as statistically significant covariates for trastuzumab emtansine PK parameters. However, the magnitude of effect of these covariates on trastuzumab emtansine exposure suggests that these covariates are unlikely to have any clinically meaningful effect on trastuzumab emtansine exposure. In addition, exploratory analysis showed that the impact of covariates (i.e., renal function, race and age) on the pharmacokinetics of total trastuzumab and DM1 was limited and was not clinically relevant. In non-clinical studies, trastuzumab emtansine catabolites including DM1, Lys-MCC-DM1, and MCC-DM1 are mainly excreted in the bile with minimal elimination in urine.

Linearity/non linearity

Trastuzumab emtansine when administered intravenously every 3 weeks exhibited linear PK across doses ranging from 2.4 to 4.8 mg/kg; patients who received doses less than or equal to 1.2 mg/kg had faster clearance.

Elderly patients

The population PK analysis showed that age did not affect the PK of trastuzumab emtansine. No significant difference was observed in the PK of trastuzumab emtansine among patients < 65 years (n = 577), patients between 65-75 years (n = 78) and patients > 75 years (n = 16).

Renal impairment

No formal PK study has been conducted in patients with renal impairment. The population PK analysis showed that creatinine clearance does not affect the PK of trastuzumab emtansine. Pharmacokinetics of trastuzumab emtansine in patients with mild (creatinine clearance CL_{Cr} 60 to 89 mL/min, n = 254) or moderate (CL_{Cr} 30 to 59 mL/min, n = 53) renal impairment were similar to those in patients with normal renal function (CL_{Cr} ≥ 90 mL/min, n = 361). Pharmacokinetic data in patients with severe renal impairment (CL_{Cr} 15 to 29 mL/min) are limited (n = 1), therefore no posology recommendations can be made.

Hepatic impairment

The liver is a primary organ for eliminating DM1 and DM1-containing catabolites. The pharmacokinetics of trastuzumab emtansine and DM1-containing catabolites were evaluated after the administration of 3.6 mg/kg of trastuzumab emtansine to metastatic HER2+ breast cancer patients with normal hepatic function (n = 10), mild (Child-Pugh A; n = 10) and moderate (Child-Pugh B; n = 8) hepatic impairment.

- Plasma concentrations of DM1 and DM1-containing catabolites (Lys-MCC-DM1 and MCC-DM1) were low and comparable between patients with and without hepatic impairment.

- Systemic exposures (AUC) of trastuzumab emtansine at Cycle 1 in patients with mild and moderate hepatic impairment were approximately 38% and 67% lower than that of patients with normal hepatic function, respectively. Trastuzumab emtansine exposure (AUC) at Cycle 3 after repeated dosing in patients with mild or moderate hepatic dysfunction was within the range observed in patients with normal hepatic function.

No formal pharmacokinetic study has been conducted and no population PK data was collected in patients with severe hepatic impairment (Child-Pugh class C).

Other special populations

The population PK analysis showed that race did not appear to influence the PK of trastuzumab emtansine. Because most of the patients in trastuzumab emtansine clinical studies were females, the effect of gender on the PK of trastuzumab emtansine was not formally evaluated.

5.3 Preclinical safety data

Animal toxicology and/or pharmacology

Administration of trastuzumab emtansine was well tolerated in rats and monkeys at doses up to 20 and 10 mg/kg, respectively, corresponding to 2040 µg DM1/m² in both species, which is approximately equivalent to the clinical dose of trastuzumab emtansine in patients. In the GLP toxicity studies, with the exception of irreversible peripheral axonal toxicity (observed only in monkeys at ≥ 10 mg/kg) and reproductive organ toxicity (observed only in rats at 60 mg/kg), partially or completely reversible dose dependent toxicities were identified in both animal models. Principal toxicities included liver (liver enzyme elevations) at ≥ 20 mg/kg and ≥ 10 mg/kg, bone marrow (reduced platelet and white blood cell count)/haematologic at ≥ 20 mg/kg and ≥ 10 mg/kg, and lymphoid organs at ≥ 20 mg/kg and ≥ 3 mg/kg, in rat and monkey, respectively.

Mutagenicity

DM1 was aneugenic or clastogenic in an *in vivo* single-dose rat bone marrow micronucleus assay at exposures that were comparable to mean maximum concentrations of DM1 measured in humans

administered trastuzumab emtansine. DM1 was not mutagenic in an *in vitro* bacterial reverse mutation (Ames) assay.

Impairment of fertility and teratogenicity

No fertility studies in animals have been performed to evaluate the effect of trastuzumab emtansine. However, based on results from general animal toxicity studies, adverse effects on fertility can be expected.

Dedicated embryo-foetal development studies have not been conducted in animals with trastuzumab emtansine. Developmental toxicity of trastuzumab has been identified in the clinical setting although it was not predicted in the non-clinical program. In addition, developmental toxicity of maytansine has been identified in non-clinical studies which suggests that DM1, the microtubule-inhibiting cytotoxic maytansinoid component of trastuzumab emtansine, will be similarly teratogenic and potentially embryotoxic.

6. PHARMACEUTICAL PARTICULARS

6.1 List of excipients

Succinic acid
Sodium hydroxide
Sucrose
Polysorbate 20

6.2 Incompatibilities

This medicinal product must not be mixed or diluted with other medicinal products except those mentioned in section 6.6.

Glucose (5%) solution should not be used for reconstitution or dilution since it causes aggregation of the protein.

6.3 Shelf life

Unopened vial

4 years.

Reconstituted solution

Chemical and physical in-use stability of the reconstituted solution has been demonstrated for up to 120 hours (5 days) at 2 °C to 8 °C when reconstituted with sterile water for injection or sodium chloride 4.5 mg/mL (0.45%). From a microbiological point of view, the product should be used immediately. If not used immediately, in-use storage times and conditions prior to use are the responsibility of the user and would normally not be longer than 24 hours at 2 °C to 8 °C, unless reconstitution has taken place in controlled and validated aseptic conditions.

Diluted solution

The reconstituted Kadcylya solution diluted in infusion bags containing sodium chloride 9 mg/mL (0.9%) solution for infusion, or sodium chloride 4.5 mg/mL (0.45%) solution for infusion, is stable for up to 24 hours at 2 °C to 8 °C, provided it was prepared under controlled and validated aseptic conditions. Particulates may be observed on storage if diluted in 0.9% sodium chloride (see section 6.6).

6.4 Special precautions for storage

Store in a refrigerator (2°C – 8°C).

For storage conditions after reconstitution and dilution of the medicinal product, see section 6.3.

6.5 Nature and contents of container

Kadcyla 100 mg powder for concentrate for solution for infusion

Kadcyla is provided in 15 mL (100 mg) Type 1 glass vial closed with a grey-butyl rubber stopper coated with fluoro-resin laminate, and sealed with an aluminium seal with a white plastic flip-off cap.

Pack of 1 vial.

Kadcyla 160 mg powder for concentrate for solution for infusion

Kadcyla is provided in 20 mL (160 mg) Type 1 glass vial closed with a grey-butyl rubber stopper coated with fluoro resin laminate, and sealed with an aluminium seal with a purple plastic flip-off cap.

Pack of 1 vial.

6.6 Special precautions for disposal and other handling

Appropriate aseptic technique should be used. Appropriate procedures for the preparation of chemotherapeutic medicinal products should be used.

The reconstituted Kadcyla solution should be diluted in polyvinyl chloride (PVC) or latex-free PVC-free polyolefin infusion bags.

The use of 0.20 or 0.22 micron in-line polyethersulfone (PES) filter is required for the infusion when the concentrate for infusion is diluted with sodium chloride 9 mg/mL (0.9%) solution for infusion.

In order to prevent medicinal product errors it is important to check the vial labels to ensure that the medicinal product being prepared is Kadcyla (trastuzumab emtansine) and not another trastuzumab-containing product (e.g. trastuzumab or trastuzumab deruxtecan).

Instructions for reconstitution

- 100 mg trastuzumab emtansine vial: Using a sterile syringe, slowly inject 5 mL of sterile water for injection or sodium chloride 4.5 mg/mL (0.45%) into the vial.
- 160 mg trastuzumab emtansine vial: Using a sterile syringe, slowly inject 8 mL of sterile water for injection or sodium chloride 4.5 mg/mL (0.45%) into the vial.
- Swirl the vial gently until completely dissolved. Do not shake.

Reconstituted solution should be inspected visually for particulate matter and discolouration prior to administration. The reconstituted solution should be free of visible particulates, clear to slightly opalescent. The colour of the reconstituted solution should be colourless to pale brown. Do not use if the reconstituted solution contains visible particulates, or is cloudy or discoloured.

Instructions for dilution

Determine the volume of the reconstituted solution required based on a dose of 3.6 mg trastuzumab emtansine/kg body weight (see section 4.2):

$$\text{Volume (mL)} = \frac{\text{Total dose to be administered (body weight (kg) x dose (mg/kg))}}{20 \text{ (mg/mL, concentration of reconstituted solution)}}$$

The appropriate amount of solution should be withdrawn from the vial and added to an infusion bag containing 250 mL of sodium chloride 4.5 mg/mL (0.45%) solution for infusion or sodium chloride 9 mg/mL (0.9%) solution for infusion. Glucose (5%) solution should not be used (see section 6.2). Sodium chloride 4.5 mg/mL (0.45%) solution for infusion may be used without a polyethersulfone (PES) 0.20 or 0.22- μ m in-line filter. If sodium chloride 9 mg/mL (0.9%) solution for infusion is used for infusion, a 0.20 or 0.22 micron in-line polyethersulfone (PES) filter is required. Once the infusion is prepared it should be administered immediately. Do not freeze or shake the infusion during storage.

Disposal

The reconstituted product contains no preservative and is intended for single use only. Discard any unused portion.

Any unused medicinal product or waste material should be disposed of in accordance with local requirements.

7. MARKETING AUTHORISATION HOLDER

Date of first authorisation: 15 November 2013
Date of latest renewal: 17 September 2018

10. DATE OF REVISION OF THE TEXT

Detailed information on this medicinal product is available on the website of the European Medicines Agency <https://www.ema.europa.eu>.

ANNEX II

- A. MANUFACTURER OF THE BIOLOGICAL ACTIVE
SUBSTANCE AND MANUFACTURER RESPONSIBLE FOR
BATCH RELEASE**
- B. CONDITIONS OR RESTRICTIONS REGARDING SUPPLY
AND USE**
- C. OTHER CONDITIONS AND REQUIREMENTS OF THE
MARKETING AUTHORISATION**
- D. CONDITIONS OR RESTRICTIONS WITH REGARD TO
THE SAFE AND EFFECTIVE USE OF THE MEDICINAL
PRODUCT**

A. MANUFACTURER OF THE BIOLOGICAL ACTIVE SUBSTANCE AND MANUFACTURER RESPONSIBLE FOR BATCH RELEASE

Name and address of the manufacturer of the biological active substance

Lonza Ltd.
Lonzastrasse
CH-3930 Visp
Switzerland

F. Hoffmann La Roche AG
Grenzacherstrasse 124
CH-4058 Basel
Switzerland

Name and address of the manufacturer responsible for batch release

Roche Pharma AG
Emil-Barell-Strasse 1
79639 Grenzach-Whylen
Germany

B. CONDITIONS OR RESTRICTIONS REGARDING SUPPLY AND USE

Medicinal product subject to restricted medical prescription (see Annex I: Summary of Product Characteristics, section 4.2).

C. OTHER CONDITIONS AND REQUIREMENTS OF THE MARKETING AUTHORISATION

• **Periodic safety update reports (PSURs)**

The requirements for submission of PSURs for this medicinal product are set out in the list of Union reference dates (EURD list) provided for under Article 107c(7) of Directive 2001/83/EC and any subsequent updates published on the European medicines web-portal.

D. CONDITIONS OR RESTRICTIONS WITH REGARD TO THE SAFE AND EFFECTIVE USE OF THE MEDICINAL PRODUCT

• **Risk management plan (RMP)**

The marketing authorisation holder (MAH) shall perform the required pharmacovigilance activities and interventions detailed in the agreed RMP presented in Module 1.8.2 of the marketing authorisation and any agreed subsequent updates of the RMP.

An updated RMP should be submitted:

- At the request of the European Medicines Agency;
- Whenever the risk management system is modified, especially as the result of new information being received that may lead to a significant change to the benefit/risk profile or as the result of an important (pharmacovigilance or risk minimisation) milestone being reached.

- **Additional risk minimisation measures**

The MAH shall agree the content and format of the Kadcyla (trastuzumab emtansine) educational material and a communication plan with the National Competent Authority in the Member State before Kadcyla (trastuzumab emtansine) is launched in each Member State.

The MAH shall ensure that in parallel to the launch of Kadcyla (trastuzumab emtansine), all health care professionals who may prescribe, dispense or administer Kadcyla (trastuzumab emtansine) and/or Herceptin (trastuzumab) are provided with a health care professional (HCP) educational pack. This HCP educational pack shall consist of the following:

- Kadcyla (trastuzumab emtansine) SmPC
- Health care professional information

The HCP information shall contain the following key messages:

1. Kadcyla (trastuzumab emtansine) is different from other trastuzumab-containing medicines such, as Herceptin (trastuzumab) or Enhertu (trastuzumab deruxtecan), with different active substances never to be used interchangeably.
2. Kadcyla (trastuzumab emtansine) is NOT a generic version of Herceptin (trastuzumab) and has different properties, indications and dose.
3. Kadcyla (trastuzumab emtansine) is an antibody-drug conjugate containing humanised anti-HER2 IgG1 antibody trastuzumab and DM1, a microtubule-inhibitory maytansinoid.
4. Do not substitute or combine Kadcyla (trastuzumab emtansine) with other trastuzumab-containing medicines such as Herceptin (trastuzumab) or Enhertu (trastuzumab deruxtecan).
5. Do not administer Kadcyla (trastuzumab emtansine) in combination with chemotherapy.
6. Do not administer Kadcyla (trastuzumab emtansine) at doses greater than 3.6 mg/kg once every 3 weeks.
7. If a prescription for Kadcyla (trastuzumab emtansine) is written electronically, it is important to ensure that the medication prescribed is trastuzumab emtansine and not another trastuzumab-containing medicine, such as Herceptin (trastuzumab) or Enhertu (trastuzumab deruxtecan).
8. Both the invented name Kadcyla and its full non-proprietary name (trastuzumab emtansine) should be used and confirmed when prescribing, preparing the infusion solution and administering Kadcyla (trastuzumab emtansine) to patients. It must be verified that the non-proprietary name is trastuzumab emtansine.
9. In order to prevent medicinal product errors it is important to review the Summary of Product Characteristics and to check the outer carton and vial labels to ensure that the medicinal product being prepared and administered is Kadcyla (trastuzumab emtansine) and not another trastuzumab-containing medicine, such as Herceptin (trastuzumab) or Enhertu (trastuzumab deruxtecan).
10. A description of the key differences between Roche products Kadcyla (trastuzumab emtansine), Herceptin and Herceptin SC (trastuzumab) in relation to indication, dose, administration and packaging differences.

ANNEX III
LABELLING AND PACKAGE LEAFLET

A. LABELLING

PARTICULARS TO APPEAR ON THE OUTER PACKAGING

CARTON

1. NAME OF THE MEDICINAL PRODUCT

Kadcyla 100 mg powder for concentrate for solution for infusion
trastuzumab emtansine

2. STATEMENT OF ACTIVE SUBSTANCE(S)

One vial of powder for concentrate for solution for infusion contains 100 mg of trastuzumab emtansine. After reconstitution one vial of 5 mL solution contains 20 mg/mL of trastuzumab emtansine.

3. LIST OF EXCIPIENTS

Excipients:
Succinic acid, sodium hydroxide, sucrose, polysorbate 20.
Read the package leaflet before use

4. PHARMACEUTICAL FORM AND CONTENTS

Powder for concentrate for solution for infusion

B. PACKAGE LEAFLET

Package leaflet: Information for the user

Kadcyla 100 mg powder for concentrate for solution for infusion **Kadcyla 160 mg powder for concentrate for solution for infusion** trastuzumab emtansine

Read all of this leaflet carefully before you start being given this medicine because it contains important information for you.

- Keep this leaflet. You may need to read it again.
- If you have any further questions, ask your doctor, pharmacist or nurse.
- If you get any side effects, talk to your doctor, pharmacist or nurse. This includes any possible side effects not listed in this leaflet. See section 4.

What is in this leaflet

1. What Kadcyla is and what it is used for
2. What you need to know before you are given Kadcyla
3. How you are given Kadcyla
4. Possible side effects
5. How to store Kadcyla
6. Contents of the pack and other information

1. What Kadcyla is and what it is used for

What Kadcyla is

Kadcyla contains the active substance trastuzumab emtansine, which is made up of two parts that are linked together:

- trastuzumab - a monoclonal antibody that binds selectively to an antigen (a target protein) called human epidermal growth factor receptor 2 (HER2). HER2 is found in large amounts on the surface of some cancer cells where it stimulates their growth. When trastuzumab binds to HER2 it can stop the cancer cells growth and cause them to die.
- DM1 – an anti-cancer substance that becomes active once Kadcyla enters the cancer cell.

What Kadcyla is used for

Kadcyla is used to treat breast cancer in adults when:

- the cancer cells have many HER2 proteins on them - your doctor will test your cancer cells for this.
- you have already received the medicine trastuzumab and a medicine known as a taxane.
- the cancer has spread to areas near the breast or to other parts of your body (metastasized).
- the cancer has not spread to other parts of the body and treatment is going to be given after surgery (treatment after surgery is called adjuvant therapy).

2. What you need to know before you are given Kadcyla

You must not be given Kadcyla

- if you are allergic to trastuzumab emtansine or any of the other ingredients of this medicine (listed in section 6).

You should not be given Kadcyla if the above applies to you. If you are not sure, talk to your doctor or nurse before you are given Kadcyla.

Warnings and precautions

Talk to your doctor or nurse before you are given Kadcyla if:

- you have ever had a serious infusion-related reaction from using trastuzumab characterised by symptoms such as flushing, chills, fever, shortness of breath, difficulty breathing, rapid heartbeat or a drop in blood pressure.
- you are receiving treatment with blood thinning medicines (e.g. warfarin, heparin).
- you have any history of liver problems. Your doctor will check your blood to test your liver function before and regularly during treatment.

If any of the above apply to you (or you are not sure), talk to your doctor or pharmacist before you are given Kadcyla.

Look out for side effects

Kadcyla can make some existing conditions worse, or cause side effects. See section 4 for more details about what side effects to look out for.

Tell your doctor or nurse straight away if you notice any of the following serious side effects while you are given Kadcyla:

- **Breathing problems:** Kadcyla can cause serious breathing problems such as shortness of breath (either at rest or while performing any type of activity) and cough. These may be signs of inflammation of your lung, which may be serious, and even fatal. If you develop lung disease your doctor may stop treatment with this medicine.
- **Liver problems:** Kadcyla can cause inflammation or damage to cells in the liver that can stop the liver from functioning normally. Inflamed or injured liver cells may leak higher than normal amounts of certain substances (liver enzymes) into the bloodstream, resulting in elevated liver enzymes in blood tests. In most cases you will not have any symptoms. Some symptoms could be yellowing of your skin and whites of your eyes (jaundice). Your doctor will check your blood to test your liver function before and regularly during treatment.
- Another rare abnormality that can occur in the liver is a condition known as nodular regenerative hyperplasia (NRH). This abnormality causes the structure of the liver to change and can change how the liver functions. Over time, this may lead to symptoms such as a bloated sensation or swelling of the abdomen due to fluid accumulation or bleeding from abnormal blood vessels in the gullet or rectum.
- **Heart problems:** Kadcyla can weaken the heart muscle. When the heart muscle is weak, patients may develop symptoms such as shortness of breath at rest or when sleeping, chest pain, swollen legs or arms, and a sensation of rapid or irregular heartbeats. Your doctor will check your heart function before and regularly during treatment. You should tell your doctor immediately if you notice any of the above symptoms.
- **Infusion-related reactions or allergic reactions:** Kadcyla can cause flushing, shivering fits, fever, trouble breathing, low blood pressure, rapid heartbeat, sudden swelling of your face, tongue, or trouble swallowing during the infusion or after the infusion on the first day of treatment. Your doctor or nurse will check to see whether you are having any of these side effects. If you develop a reaction, they will slow down or stop the infusion and may give you treatment to counteract the side effects. The infusion may be continued after the symptoms improve.
- **Bleeding problems:** Kadcyla can lower the number of platelets in your blood. Platelets help your blood to clot so you might get unexpected bruising or bleeding (such as nose bleeds, bleeding from gums). Your doctor will check your blood regularly for decreased platelets. You should tell your doctor immediately if you notice any unexpected bruising or bleeding.

- **Neurological problems:** Kadcyła can damage nerves. You may experience tingling, pain, numbness, itching, crawling sensation, pins and needles in your hands and feet. Your doctor will monitor you for signs and symptoms of neurological problems.
- **Injection site reaction:** If you get a burning sensation, feel pain or tenderness at the infusion site during the infusion, this could indicate that Kadcyła has leaked outside the blood vessel. Tell your doctor or nurse immediately. If Kadcyła has leaked outside the blood vessel, increased pain, discolouration, blistering and sloughing of your skin (skin necrosis) can occur within days or weeks after the infusion.

Tell your doctor or nurse straight away if you notice any of the side effects above.

Children and adolescents

Kadcyła is not recommended for anyone under the age of 18 years. This is because there is no information on how well it works in this age group.

Other medicines and Kadcyła

Tell your doctor or nurse if you are taking, have recently taken or might take any other medicines.

In particular, tell your doctor or pharmacist if you are taking:

- any medicines to thin your blood such as warfarin or decrease the ability to form blood clots such as aspirin
- medicines for fungal infections called ketoconazole, itraconazole or voriconazole
- antibiotics for infections called clarithromycin or telithromycin
- medicines for HIV called atazanavir, indinavir, nelfinavir, ritonavir or saquinavir.
- medicine for depression called nefazodone

If any of the above apply to you (or you are not sure), talk to your doctor or pharmacist before you are given Kadcyła.

Pregnancy

Kadcyła is not recommended if you are pregnant because this medicine may cause harm to the unborn baby.

- Tell your doctor before using Kadcyła if you are pregnant, think you may be pregnant or are planning to have a baby.
- Use effective contraception to avoid becoming pregnant while you are being treated with Kadcyła. Talk to your doctor about the best contraception for you.
- You should continue to take your contraception for at least 7 months after your last dose of Kadcyła. Talk to your doctor before stopping your contraception.
- Male patients or their female partners should also use effective contraception.
- If you do become pregnant during treatment with Kadcyła, tell your doctor straight away.

Breast-feeding

You should not breast-feed during treatment with Kadcyła. Also you should not breast-feed for 7 months after your last infusion of Kadcyła. It is not known whether the ingredients in Kadcyła pass into breast milk. Talk to your doctor about this.

Driving and using machines

It is not expected that Kadcyła will affect your ability to drive, cycle, use tools or machines. If you experience flushing, shivering fits, fever, trouble breathing, low blood pressure or a rapid heartbeat (infusion-related reaction), blurred vision, tiredness, headache, or dizziness, do not drive, cycle, use tools or machines until these reactions stop.

Important information about some of the ingredients of Kadcyła

This medicine contains less than 1 mmol sodium (23 mg) per dose. It is essentially 'sodium-free'.

Kadcyła 100 mg powder for concentrate for solution for infusion

This medicine contains 1.1 mg of polysorbate 20 in each vial which is equivalent to 0.22 mg/mL.

Kadcyła 160 mg powder for concentrate for solution for infusion

This medicine contains 1.7 mg of polysorbate 20 in each vial which is equivalent to 0.21 mg/mL. Polysorbates may cause allergic reactions. Tell your doctor if you have any known allergies.

3. How you are given Kadcyła

Kadcyła will be given to you by a doctor or nurse in a hospital or clinic:

- It is given by a drip into a vein (intravenous infusion).
- You will be given one infusion every 3 weeks.

How much you will be given

- You will be given 3.6 mg of Kadcyła for every kilogram of your body weight. Your doctor will calculate the correct dose for you.
- The first infusion will be given to you over 90 minutes. You will be observed by a doctor or nurse while it is being given and for at least 90 minutes following the initial dose, in case you have any side effects.
- If the first infusion is well tolerated, the infusion on your next visit may be given over 30 minutes. You will be observed by a doctor or nurse while it is being given and for at least 30 minutes following the dose, in case you have any side effects.
- The total number of infusions that you will be given depends on how you respond to the treatment and which indication is treated.
- If you experience side effects, your doctor may decide to continue your treatment but lower your dose, delay the next dose or stop the treatment.

If you miss a Kadcyła treatment

If you forget or miss your Kadcyła appointment, make another appointment as soon as possible. Do not wait until your next planned visit.

If you stop Kadcyła treatment

Do not stop treatment with this medicine without talking to your doctor first.

If you have any further questions on the use of this medicine, ask your doctor or nurse.

4. Possible side effects

Like all medicines, this medicine can cause side effects, although not everybody gets them.

Tell your doctor or nurse straight away if you notice any of following serious side effects.

Very common (may affect more than 1 in 10 people):

- Kadcyła may cause inflammation or damage to cells in the liver, resulting in elevated liver enzymes in blood tests. However, in most cases during Kadcyła treatment, liver enzyme levels are elevated mildly and temporarily, do not cause any symptoms, and do not affect liver function.
- Unexpected bruising and bleeding (such as nose bleeds).
- Tingling, pain, numbness, itching, crawling sensation, pins and needles in your hands and feet. These symptoms may indicate nerve damage.

Common (may affect up to 1 in 10 people):

- Flushing, shivering fits, fever, trouble breathing, low blood pressure or a rapid heartbeat during the infusion or up to 24 hours after the infusion – these are so-called infusion-related reactions.
- Heart problems can occur. Most patients will not have symptoms from the heart problems. If symptoms do occur, cough, shortness of breath at rest or when sleeping flat, chest pain and swollen ankles or arms, a sensation of rapid or irregular heartbeats may be observed.

Uncommon (may affect up to 1 in 100 people):

- Inflammation of your lungs can cause breathing problems such as shortness of breath (either at rest or while performing any type of activity), coughing or coughing spells with a dry cough – these are signs of inflammation of your lung tissue.
- Allergic reactions can occur and most patients will have mild symptoms such as itching or tightness in the chest. In more severe cases, swelling of your face or tongue, trouble swallowing or difficulty breathing may occur.

Rare (may affect up to 1 in 1000 people):

- Your skin and whites of your eyes get yellow (jaundice) – these could be signs of severe liver damage.

Frequency not known:

- If Kadcyła infusion solution leaks into the area around the infusion site you may develop pain, discolouration, blistering and sloughing of your skin (skin necrosis) at the infusion site. Contact your doctor or nurse immediately.

Tell your doctor or nurse straight away if you notice any of the serious side effects above.

Other side effects include**Very common:** may affect more than 1 in 10 people

- decreased red blood cells (shown in a blood test)
- being sick (vomiting)
- diarrhoea
- dry mouth
- urinary tract infection
- constipation
- stomach ache
- cough
- shortness of breath
- inflammation of the mouth
- difficulty sleeping
- muscle or joint pain
- fever
- headache
- feeling tired
- weakness

Common: may affect up to 1 in 10 people

- chills or flu like symptoms
- decrease in your potassium levels (shown in a blood test)
- skin rashes
- decreased white blood cells (shown in a blood test)
- dry eyes, watery eyes or blurred vision
- eye redness or infection
- indigestion
- swelling of legs and/or arms
- bleeding from the gums
- increase in blood pressure

- feeling dizzy
- taste disturbances
- itching
- difficulty in remembering
- hair loss
- hand-and-foot skin reaction (Palmar-plantar erythrodysesthesia syndrome)
- nail disorder

Uncommon: may affect up to 1 in 100 people

- Another abnormality that can be caused by Kadcyła is a condition known as nodular regenerative hyperplasia of the liver. This abnormality causes the structure of the liver to change. Patients develop multiple nodules in the liver that can change how the liver functions. Over time, this may lead to symptoms such as a bloated sensation or swelling of the abdomen due to fluid accumulation or bleeding from abnormal blood vessels in the gullet or rectum.
- If the Kadcyła infusion solution leaks into the area around the infusion site you may develop tenderness or redness of your skin, or swelling at the infusion site.

If you get any of the side effects after your treatment with Kadcyła has stopped, talk to your doctor or nurse and tell them that you have been treated with Kadcyła.

Reporting of side effects

If you get any side effects, talk to your doctor or nurse. This includes any possible side effects not listed in this leaflet.

You can also report side effects directly via [the national reporting system listed in Appendix V](#). By reporting side effects you can help provide more information on the safety of this medicine.

5. How to store Kadcyła

Kadcyła will be stored by the healthcare professionals at the hospital or clinic.

- Keep this medicine out of the sight and reach of children.
- Do not use this medicine after the expiry date which is stated on the outer carton and vial after EXP. The expiry date refers to the last day of that month.
- Store in a refrigerator (2 °C - 8 °C). Do not freeze.
- When reconstituted in the vial, Kadcyła is stable for up to 120 hours (5 days) at 2 °C to 8 °C. After dilution into an infusion bag, the solution is stable for 24 hours at 2 °C to 8 °C, and must be discarded thereafter.
- Do not throw away any medicines via wastewater or household waste. Ask your pharmacist how to dispose of medicines you no longer use. These measures will help to protect the environment.

6. Contents of the pack and other information

What Kadcyła contains

- The active substance is trastuzumab emtansine.
- Kadcyła 100 mg: One vial of powder for concentrate for solution for infusion contains 100 mg of trastuzumab emtansine. After reconstitution one vial of 5 mL solution contains 20 mg/mL of trastuzumab emtansine.
- Kadcyła 160 mg: One vial of powder for concentrate for solution for infusion contains 160 mg of trastuzumab emtansine. After reconstitution one vial of 8 mL solution contains 20 mg/mL of trastuzumab emtansine.
- The other ingredients are succinic acid, sodium hydroxide (see section 2 under ‘Important information about some of the ingredients of Kadcyła’), sucrose, and polysorbate 20.

What Kadcyła looks like and contents of the pack

- Kadcyła is a white to off-white lyophilised powder for concentrate for solution for infusion supplied in glass vials.
- Kadcyła is available in packs containing 1 vial.

Other sources of information

Detailed information on this medicine is available on the European Medicines Agency web site:

<https://www.ema.europa.eu>.

The following information is intended for medical or healthcare professionals only:

In order to prevent medicinal product errors it is important to check the vial labels to ensure that the medicinal product being prepared is Kadcyła (trastuzumab emtansine) and not another trastuzumab-containing product (e.g. trastuzumab or trastuzumab deruxtecan).

Kadcyła must be reconstituted and diluted by a healthcare professional and administered as an intravenous infusion. It must not be administered as an intravenous push or bolus.

Always keep this medicine in the closed original pack at a temperature of 2 °C – 8 °C in a refrigerator. A vial of Kadcyła reconstituted with water for injections or sodium chloride 4.5 mg/mL (0.45%) (not supplied) is stable for up to 120 hours (5 days) at 2 °C – 8 °C after reconstitution and must not be frozen.

Appropriate aseptic technique should be used. Appropriate procedures for the preparation of chemotherapeutic medicinal products should be used.

The reconstituted Kadcyła solution should be diluted in polyvinyl chloride (PVC) or latex-free PVC-free polyolefin infusion bags.

The use of 0.20 or 0.22 micron in-line polyethersulfone (PES) filter is required for the infusion when the concentrate for infusion is diluted with sodium chloride 9 mg/mL (0.9%) solution for infusion.

Instructions for reconstitution

- **Kadcyła 100 mg:** using a sterile syringe, slowly inject 5 mL of sterile water for injection or sodium chloride 4.5 mg/mL (0.45%) into the 100 mg trastuzumab emtansine vial.
- **Kadcyła 160 mg:** using a sterile syringe, slowly inject 8 mL of sterile water for injection or sodium chloride 4.5 mg/mL (0.45%) into the 160 mg trastuzumab emtansine vial.
- Swirl the vial gently until completely dissolved. Do not shake.

Reconstituted solution should be inspected visually for particulate matter and discoloration prior to administration. The reconstituted solution should be free of visible particulates, clear to slightly opalescent. The colour of the reconstituted solution should be colourless to pale brown. Do not use if reconstituted solution is cloudy or discoloured.

Discard any unused portion. The reconstituted product contains no preservative and is intended for single use only.

Instructions for dilution

Determine the volume of the reconstituted solution required based on a dose of 3.6 mg trastuzumab emtansine/kg body weight:

$$\text{Volume (mL)} = \frac{\text{Total dose to be administered}}{20 \text{ (mg/mL, concentration of reconstituted solution)}} = (\text{body weight (kg)} \times \text{dose (mg/kg)})$$

The appropriate amount of solution should be withdrawn from the vial and added to an infusion bag containing 250 mL of sodium chloride 4.5 mg/mL (0.45%) solution for infusion or sodium chloride 9 mg/mL (0.9%) solution for infusion. Glucose (5%) solution should not be used. Sodium chloride 4.5 mg/mL (0.45%) solution for infusion may be used without a polyethersulfone (PES) 0.20 or 0.22-µm in-line filter. If sodium chloride 9 mg/mL (0.9%) solution for infusion is used for infusion, a 0.20 or 0.22 micron in-line polyethersulfone (PES) filter is required. Once the infusion is prepared it should be administered immediately. Do not freeze or shake the infusion during storage. If diluted aseptically, it may be stored for up to 24 hours at 2 °C to 8 °C.
