ANNEX I

SUMMARY OF PRODUCT CHARACTERISTICS
1. NAME OF THE MEDICINAL PRODUCT

Kevzara 150 mg solution for injection in pre-filled syringe
Kevzara 150 mg solution for injection in pre-filled pen
Kevzara 200 mg solution for injection in pre-filled syringe
Kevzara 200 mg solution for injection in pre-filled pen

2. QUALITATIVE AND QUANTITATIVE COMPOSITION

150 mg solution for injection
Each single-dose pre-filled syringe contains 150 mg sarilumab in 1.14 ml solution (131.6 mg/ml).
Each single-dose pre-filled pen contains 150 mg sarilumab in 1.14 ml solution (131.6 mg/ml).

200 mg solution for injection
Each single-dose pre-filled syringe contains 200 mg sarilumab in 1.14 ml solution (175 mg/ml).
Each single-dose pre-filled pen contains 200 mg sarilumab in 1.14 ml solution (175 mg/ml).

Sarilumab is a human monoclonal antibody selective for the interleukin-6 (IL-6) receptor, produced in
Chinese Hamster Ovary cells by recombinant DNA technology.
For the full list of excipients see section 6.1.

3. PHARMACEUTICAL FORM

Solution for injection (injection)
Clear, colourless to pale yellow sterile solution of approximately pH 6.0.

4. CLINICAL PARTICULARS

4.1 Therapeutic indications

Kevzara in combination with methotrexate (MTX) is indicated for the treatment of moderately to
severely active rheumatoid arthritis (RA) in adult patients who have responded inadequately to, or who
are intolerant to one or more disease modifying anti rheumatic drugs (DMARDs). Kevzara can be
given as monotherapy in case of intolerance to MTX or when treatment with MTX is inappropriate
(see section 5.1).

4.2 Posology and method of administration

Treatment should be initiated and supervised by healthcare professionals experienced in the diagnosis
and treatment of rheumatoid arthritis. Patients treated with Kevzara should be given the patient alert
card.

Posology
The recommended dose of Kevzara is 200 mg once every 2 weeks administered as a subcutaneous
injection.
Reduction of dose from 200 mg once every 2 weeks to 150 mg once every 2 weeks is recommended for management of neutropenia, thrombocytopenia, and liver enzyme elevations.

**Dose modification:**
Treatment with Kevzara should be withheld in patients who develop a serious infection until the infection is controlled.

Initiating treatment with Kevzara is not recommended in patients with a low neutrophil count, i.e., absolute neutrophil count (ANC) less than 2 x 10^9/L.

Initiating treatment with Kevzara is not recommended in patients with a platelet count below 150 x 10^3/µL.

Recommended dose modifications in case of neutropenia, thrombocytopenia, or liver enzyme elevations (see sections 4.4 and 4.8):

### Low Absolute Neutrophil Count (see section 5.1)

</tbody>
</table>

**Missed dose**
If a dose of Kevzara is missed and it has been 3 days or less since the missed dose, the next dose should be administered as soon as possible. The subsequent dose should be administered at the regularly scheduled time. If it has been 4 days or more since the missed dose, the subsequent dose should be administered at the next regularly scheduled time, the dose should not be doubled.

**Special Populations**

**Renal impairment:**
No dose adjustment is required in patients with mild to moderate renal impairment. Kevzara has not been studied in patients with severe renal impairment (see section 5.2).
**Hepatic impairment:**
The safety and efficacy of Kevzara have not been studied in patients with hepatic impairment, including patients with positive hepatitis B virus (HBV) or hepatitis C virus (HCV) serology (see section 4.4).

**Elderly:**
No dose adjustment is required in patients over 65 years of age (see section 4.4).

**Paediatric population:**
The safety and efficacy of Kevzara in children up to 18 years of age have not been established. No data are available.

**Method of Administration**
Subcutaneous use.

The total content (1.14 ml) of the pre-filled syringe/pre-filled pen should be administered as a subcutaneous injection. Injection sites (abdomen, thigh and upper arm) should be rotated with each injection. Kevzara should not be injected into skin that is tender, damaged, or has bruises or scars.

A patient may self-inject Kevzara or the patient's caregiver may administer Kevzara if their healthcare professional determines that it is appropriate. Proper training should be provided to patients and/or caregivers on the preparation and administration of Kevzara prior to use.

For further details on administration of this medicinal product see section 6.6.

**4.3 Contraindications**

Hypersensitivity to the active substance or any of the excipients listed in section 6.1.

Active, severe infections (see section 4.4).

**4.4 Special warnings and precautions for use**

**Traceability of Kevzara**
In order to improve the traceability of biological medicinal products, the name and the batch number of the administered product should be clearly recorded.

**Serious infections**
Patients should be closely monitored for the development of signs and symptoms of infection during treatment with Kevzara (see sections 4.2 and 4.8). As there is a higher incidence of infections in the elderly population in general, caution should be used when treating the elderly.

Kevzara should not be administered in patients with an active infection, including localised infections. Consider the risks and benefits of treatment prior to initiating Kevzara in patients who have:
- chronic or recurrent infection;
- a history of serious or opportunistic infections;
- HIV infection;
- underlying conditions that may predispose them to infection;
- been exposed to tuberculosis; or
- lived in or travelled to areas of endemic tuberculosis or endemic mycoses.

Treatment with Kevzara should be withheld if a patient develops a serious infection or an opportunistic infection.

A patient who develops an infection during treatment with Kevzara should also undergo prompt and complete diagnostic testing appropriate for an immunocompromised patient; appropriate antimicrobial therapy should be initiated, and the patient should be closely monitored.
Serious and sometimes fatal infections due to bacterial, mycobacterial, invasive fungal, viral, or other opportunistic pathogens have been reported in patients receiving immunosuppressive agents including Kevzara for RA. The most frequently observed serious infections with Kevzara included pneumonia and cellulitis (see section 4.8). Among opportunistic infections, tuberculosis, candidiasis, and pneumocystis were reported with Kevzara. In isolated cases, disseminated rather than localised infections were observed in patients often taking concomitant immunosuppressants such as MTX or corticosteroids, which in addition to RA may predispose them to infections.

**Tuberculosis**

Patients should be evaluated for tuberculosis risk factors and tested for latent infection prior to initiating treatment with Kevzara. Patients with latent or active tuberculosis should be treated with standard antimycobacterial therapy before initiating Kevzara. Consider anti-tuberculosis therapy prior to initiation of Kevzara in patients with a past history of latent or active tuberculosis in whom an adequate course of treatment cannot be confirmed, and for patients with a negative test for latent tuberculosis but having risk factors for tuberculosis infection. When considering anti-tuberculosis therapy, consultation with a physician with expertise in tuberculosis may be appropriate.

Patients should be closely monitored for the development of signs and symptoms of tuberculosis including patients who tested negative for latent tuberculosis infection prior to initiating therapy.

**Viral reactivation**

Viral reactivation has been reported with immunosuppressive biologic therapies. Cases of herpes zoster were observed in clinical studies with Kevzara. No cases of Hepatitis B reactivation were reported in the clinical studies; however patients who were at risk for reactivation were excluded.

**Laboratory parameters**

**Neutrophil count**

Treatment with Kevzara was associated with a higher incidence of decrease in ANC. Decrease in ANC was not associated with higher incidence of infections, including serious infections.

- Initiating treatment with Kevzara is not recommended in patients with a low neutrophil count, i.e., ANC less than $2 \times 10^9/L$. In patients who develop an ANC less than $0.5 \times 10^9/L$, treatment with Kevzara should be discontinued.
- Neutrophil count should be monitored 4 to 8 weeks after start of therapy and according to clinical judgment thereafter. For recommended dose modifications based on ANC results see section 4.2.
- Based on the pharmacodynamics of the changes in ANC, use results obtained at the end of the dosing interval when considering dose modification (see section 5.1).

**Platelet count**

Treatment with Kevzara was associated with a reduction in platelet counts in clinical studies. Reduction in platelets was not associated with bleeding events (see section 4.8).

- Initiating treatment with Kevzara is not recommended in patients with a platelet count below $150 \times 10^3/µL$. In patients who develop a platelet count less than $50 \times 10^3/µL$, treatment with Kevzara should be discontinued.
- Platelet count should be monitored 4 to 8 weeks after start of therapy and according to clinical judgment thereafter. For recommended dose modifications based on platelet counts see section 4.2.

**Liver enzymes**

Treatment with Kevzara was associated with a higher incidence of transaminase elevations. These elevations were transient and did not result in any clinically evident hepatic injury in clinical studies (see section 4.8). Increased frequency and magnitude of these elevations were observed when potentially hepatotoxic medicinal products (e.g., MTX) were used in combination with Kevzara.

Initiating treatment with Kevzara is not recommended in patients with elevated transaminases, ALT or AST greater than $1.5 \times ULN$. In patients who develop elevated ALT greater than $5 \times ULN$, treatment with Kevzara should be discontinued (see section 4.2).
ALT and AST levels should be monitored 4 to 8 weeks after start of therapy and every 3 months thereafter. When clinically indicated, consider other liver function tests such as bilirubin. For recommended dose modifications based on transaminase elevations see section 4.2.

**Lipid abnormalities**
Lipid levels may be reduced in patients with chronic inflammation. Treatment with Kevzara was associated with increases in lipid parameters such as LDL cholesterol, HDL cholesterol, and/or triglycerides (see section 4.8).

Lipid parameters should be assessed approximately 4 to 8 weeks following initiation of treatment with Kevzara, then at approximately 6 month intervals.

Patients should be managed according to clinical guidelines for the management of hyperlipidaemia.

**Gastrointestinal perforation and diverticulitis**
Cases of gastrointestinal perforation and diverticulitis have been reported in association with Kevzara. Gastrointestinal perforation has been reported in patients with and without diverticulitis. Use Kevzara with caution in patients with previous history of intestinal ulceration or diverticulitis. Patients presenting with new onset abdominal symptoms such as persistent pain with fever should be evaluated promptly (see section 4.8).

**Malignancies**
Treatment with immunosuppressants may result in an increased risk of malignancies. The impact of treatment with Kevzara on the development of malignancies is not known but malignancies were reported in clinical studies (see section 4.8).

**Hypersensitivity reactions**
Hypersensitivity reactions have been reported in association with Kevzara (see section 4.8). Injection site rash, rash, and urticaria were the most frequent hypersensitivity reactions. Patients should be advised to seek immediate medical attention if they experience any symptoms of a hypersensitivity reaction. If anaphylaxis or other hypersensitivity reaction occurs, administration of Kevzara should be stopped immediately. Kevzara should not be administered to patients with known hypersensitivity to sarilumab (see section 4.3).

**Hepatic impairment**
Treatment with Kevzara is not recommended in patients with active hepatic disease or hepatic impairment (see sections 4.2 and 4.8).

**Vaccinations**
Avoid concurrent use of live vaccines as well as live attenuated vaccines during treatment with Kevzara as clinical safety has not been established. No data are available on the secondary transmission of infection from persons receiving live vaccines to patients receiving Kevzara. Prior to initiating Kevzara, it is recommended that all patients be brought up to date with all immunisations in agreement with current immunisation guidelines. The interval between live vaccinations and initiation of Kevzara therapy should be in accordance with current vaccination guidelines regarding immunosuppressive agents (see section 4.5).

**Cardiovascular risk**
RA patients have an increased risk for cardiovascular disorders and risk factors (e.g. hypertension, hyperlipidaemia) should be managed as part of usual standard of care.

**4.5 Interaction with other medicinal products and other forms of interaction**
Sarilumab exposure was not affected when coadministered with MTX based on the population pharmacokinetic analyses and across study comparisons. MTX exposure is not expected to be changed by sarilumab coadministration; however, no clinical data was collected. Kevzara has not been
investigated in combination with Janus kinase (JAK) inhibitors or biological DMARDs such as Tumor Necrosis Factor (TNF) antagonists.

Various *in vitro* and limited *in vivo* human studies have shown that cytokines and cytokine modulators can influence the expression and activity of specific cytochrome P450 (CYP) enzymes (CYP1A2, CYP2C9, CYP2C19, and CYP3A4) and therefore have the potential to alter the pharmacokinetics of concomitantly administered medicinal products that are substrates of these enzymes. Elevated levels of interleukin-6 (IL-6) may down-regulate CYP activity such as in patients with RA and hence increase drug levels compared to subjects without RA. Blockade of IL-6 signalling by IL-6Rα antagonists such as sarilumab might reverse the inhibitory effect of IL-6 and restore CYP activity, leading to altered medicinal products concentrations.

The modulation of IL-6 effect on CYP enzymes by sarilumab may be clinically relevant for CYP substrates with a narrow therapeutic index, where the dose is individually adjusted. Upon initiation or discontinuation of Kevzara in patients being treated with CYP substrate medicinal products, therapeutic monitoring of effect (e.g., warfarin) or drug concentration (e.g., theophylline) should be performed and the individual dose of the medicinal product should be adjusted as needed.

Caution should be exercised in patients who start Kevzara treatment while on therapy with CYP3A4 substrates (e.g., oral contraceptives or statins), as Kevzara may reverse the inhibitory effect of IL-6 and restore CYP3A4 activity, leading to decreased exposure and activity of CYP3A4 substrate. (see section 5.2). Interaction of sarilumab with substrates of other CYPs (CYP2C9, CYP 2C19, CYP2D6) has not been studied.

### 4.6 Fertility, pregnancy and lactation

**Women of childbearing potential**
Women of childbearing potential should use effective contraception during and up to 3 months after treatment.

**Pregnancy**
There are no or limited amount of data from the use of sarilumab in pregnant women. Animal studies do not indicate direct or indirect harmful effects with respect to reproductive toxicity (see section 5.3).

Kevzara should not be used during pregnancy unless the clinical condition of the woman requires treatment with sarilumab.

**Breast-feeding**
It is unknown whether sarilumab is excreted in human milk or absorbed systemically after ingestion. The excretion of sarilumab in milk has not been studied in animals (see section 5.3). Because IgG1 are excreted in human milk, a decision should be made whether to discontinue breast-feeding or to discontinue sarilumab therapy taking into account the benefit of breast-feeding for the child and the benefit of therapy for the woman.

**Fertility**
No data are available on the effect of sarilumab on human fertility. Animal studies showed no impairment of male or female fertility (see section 5.3).

### 4.7 Effects on ability to drive and use machines

Kevzara has no or negligible influence on the ability to drive or operate machinery.
4.8 Undesirable effects

**Summary of the safety profile**

The most frequent adverse reactions observed with Kevzara in clinical studies were neutropenia, increased ALT, injection site erythema, upper respiratory infections, and urinary tract infections. The most common serious adverse reactions were infections (see section 4.4).

**Tabulated list of adverse reactions**

The safety of Kevzara in combination with DMARDs was evaluated based on data from seven clinical studies, of which two were placebo-controlled, consisting of 2887 patients (long-term safety population). Of these, 2170 patients received Kevzara for at least 24 weeks, 1546 for at least 48 weeks, 1020 for at least 96 weeks, and 624 for at least 144 weeks.

The frequency of adverse reactions listed below is defined using the following convention: very common (≥ 1/10); common (≥ 1/100 to < 1/10); uncommon (≥ 1/1,000 to < 1/100); rare (≥ 1/10,000 to < 1/1,000); very rare (< 1/10,000). Within each frequency grouping, undesirable effects are presented in order of decreasing seriousness.

* Adverse reactions listed in the table have been reported in controlled clinical studies.

**Description of selected adverse reactions**

**Infections**

In the placebo-controlled population, the rates of infections were 84.5, 81.0, and 75.1 events per 100 patient-years, in the 200 mg and 150 mg Kevzara + DMARDs and placebo + DMARDs groups respectively. The most commonly reported infections (5% to 7% of patients) were upper respiratory tract infections, urinary tract infections, and nasopharyngitis. The rates of serious infections were 4.3, 3.0, and 3.1 events per 100 patient-years, in the 200 mg, 150 mg Kevzara + DMARDs, and placebo + DMARDs groups, respectively.

In the Kevzara + DMARDs long-term safety population, the rates of infections and serious infection were 57.3 and 3.4 events per 100-patient years, respectively.

The most frequently observed serious infections included pneumonia and cellulitis. Cases of opportunistic infection have been reported (see section 4.4).
The overall rates of infections and serious infections in the Kevzara monotherapy population were consistent with rates in the Kevzara + DMARDs population.

**Gastrointestinal perforation**
Gastrointestinal perforation was reported in patients with and without diverticulitis. Most patients who developed gastrointestinal perforations were taking concomitant nonsteroidal anti-inflammatory medications (NSAIDs), corticosteroids, or methotrexate. The contribution of these concomitant medications relative to Kevzara in the development of gastrointestinal perforations is not known (see section 4.4).

**Hypersensitivity reactions**
In the placebo-controlled population, the proportion of patients who discontinued treatment due to hypersensitivity reactions was higher among those treated with Kevzara (0.9% in 200 mg group, 0.5% in 150 mg group) than placebo (0.2%). The rates of discontinuations due to hypersensitivity in the Kevzara + DMARDs long-term safety population and the Kevzara monotherapy population were consistent with the placebo-controlled population. In the placebo-controlled population, 0.2% of the patients treated with Kevzara 200 mg q2w + DMARD reported serious adverse events of hypersensitivity reactions, and none from Kevzara 150 mg q2w + DMARD group.

**Injection site reactions**
In the placebo-controlled population, injection site reactions were reported in 9.5%, 8%, and 1.4% of patients receiving Kevzara 200 mg, 150 mg, and placebo respectively. These injection site reactions (including erythema and pruritus) were mild in severity for the majority of patients. Two patients on Kevzara (0.2%) discontinued treatment due to injection site reactions.

**Laboratory abnormalities**
To allow for a direct comparison of frequency of laboratory abnormalities between placebo and active treatment, data from weeks 0-12 were used as this was prior to patients being permitted to switch from placebo to Kevzara.

**Neutrophil count**
Decreases in neutrophil counts below $1 \times 10^9/L$ occurred in 6.4% and 3.6% of patients in the 200 mg and 150 mg Kevzara + DMARDs group, respectively, compared to no patients in the placebo + DMARDs group. Decreases in neutrophil counts below $0.5 \times 10^9/L$ occurred in 0.8% and 0.6% of patients in the 200 mg and 150 mg Kevzara+ DMARDs groups, respectively. In patients experiencing a decrease in absolute neutrophil count (ANC), modification of treatment regimen such as interruption of Kevzara or reduction in dose resulted in an increase or normalization of ANC (see section 4.2). Decrease in ANC was not associated with higher incidence of infections, including serious infections.

In the Kevzara + DMARDs long-term safety population and the Kevzara monotherapy population, the observations on neutrophil counts were consistent with those seen in the placebo-controlled population (see section 4.4).

**Platelet count**
Decreases in platelet counts below $100 \times 10^3/µL$ occurred in 1.2% and 0.6% of patients on 200 mg and 150 mg Kevzara + DMARDs, respectively, compared to no patients on placebo + DMARDs.

In the Kevzara + DMARDs long-term safety population and the Kevzara monotherapy population, the observations on platelet counts were consistent with those seen in the placebo-controlled population.

There were no bleeding events associated with decreases in platelet count.
Liver enzymes
Liver enzyme abnormalities are summarised in Table 2. In patients experiencing liver enzyme elevation, modification of treatment regimen, such as interruption of Kevzara or reduction in dose, resulted in decrease or normalization of liver enzymes (see section 4.2). These elevations were not associated with clinically relevant increases in direct bilirubin, nor were they associated with clinical evidence of hepatitis or hepatic insufficiency (see section 4.4).

Lipids
Lipid parameters (LDL, HDL, and triglycerides) were first assessed at 4 weeks following initiation of Kevzara+ DMARDs in the placebo-controlled population. At Week 4 the mean LDL increased by 14 mg/dL; mean triglycerides increased by 23 mg/dL; and mean HDL increased by 3 mg/dL. After Week 4 no additional increases were observed. There were no meaningful differences between doses.

In the Kevzara + DMARDs long-term safety population and the Kevzara monotherapy population, the observations in lipid parameters were consistent with those seen in the placebo-controlled population.

Immunogenicity
As with all therapeutic proteins, there is a potential for immunogenicity with Kevzara.

In the placebo-controlled population, 4.0%, 5.6%, and 2.0% of patients treated with Kevzara 200 mg + DMARDs, Kevzara 150 mg + DMARDs and placebo + DMARDs respectively, exhibited a positive response in the anti-drug antibody (ADA) assay. Positive responses in the neutralizing antibody (NAb) assay were detected in 1.0%, 1.6%, and 0.2% of patients on Kevzara 200 mg, Kevzara 150 mg, and placebo respectively.

In the Kevzara monotherapy population, observations were consistent with the Kevzara + DMARDs population.

Anti Drug Antibody (ADA) formation may affect pharmacokinetics of Kevzara. No correlation was observed between ADA development and either loss of efficacy or adverse events.

The detection of an immune response is highly dependent on the sensitivity and specificity of the assays used and testing conditions. For these reasons, comparison of the incidence of antibodies to Kevzara with the incidence of antibodies to other products may be misleading.

Malignancies
In the placebo-controlled population, malignancies occurred at the same rate in patients receiving either Kevzara + DMARDs or placebo + DMARDs (1.0 events per 100 patient-years).

In the Kevzara + DMARDs long-term safety population and the Kevzara monotherapy population, the rates of malignancies were consistent with the rate observed in the placebo-controlled population (see section 4.4).
Reporting of suspected adverse reactions

Reporting suspected adverse reactions after authorisation of the medicinal product is important. It allows continued monitoring of the benefit/risk balance of the medicinal product. Healthcare professionals are asked to report any suspected adverse reactions via the national reporting system listed in Appendix V.

4.9 Overdose

There are limited data available on overdose with Kevzara. There is no specific treatment for Kevzara overdose. In the event of an overdose, the patient should be closely monitored, treated symptomatically, and supportive measures instituted as required.

5. PHARMACOLOGICAL PROPERTIES

5.1 Pharmacodynamic properties

Pharmacotherapeutic group: Immunosuppressants, Interleukin inhibitors, ATC code: L04AC14

Mechanism of action

Sarilumab is a human monoclonal antibody (IgG1 subtype) that specifically binds to both soluble and membrane-bound IL-6 receptors (IL-6Rα), and inhibits IL-6-mediated signalling which involves ubiquitous signal-transducing glycoprotein 130 (gp130) and the Signal Transducer and Activator of Transcription-3 (STAT-3).

In functional human cell-based assays, sarilumab was able to block the IL-6 signalling pathway, measured as STAT-3 inhibition, only in the presence of IL-6.

IL-6 is a pleiotropic cytokine that stimulates diverse cellular responses such as proliferation, differentiation, survival, and apoptosis and can activate hepatocytes to release acute-phase proteins, including C-reactive protein (CRP) and serum amyloid A. Elevated levels of IL-6 are found in the synovial fluid of patients with rheumatoid arthritis and play an important role in both the pathologic inflammation and joint destruction which are hallmarks of RA. IL-6 is involved in diverse physiological processes such as migration and activation of T-cells, B-cells, monocytes, and osteoclasts leading to systemic inflammation, synovial inflammation, and bone erosion in patients with RA.

The activity of sarilumab in reducing inflammation is associated with laboratory changes such as decrease in ANC and elevation in lipids (see section 4.4).

Pharmacodynamic effects

Following single-dose subcutaneous (SC) administration of sarilumab 200 mg and 150 mg in patients with RA rapid reduction of CRP levels was observed. Levels were reduced to normal as early as 4 days after treatment initiation. Following single-dose sarilumab administration, in patients with RA, ANC decreased to the nadir between 3 to 4 days and thereafter recovered towards baseline (see section 4.4). Treatment with sarilumab resulted in decreases in fibrinogen and serum amyloid A, and increases in haemoglobin and serum albumin.

Clinical efficacy

The efficacy and safety of Kevzara were assessed in three randomised, double-blind, controlled multicentre studies (MOBILITY and TARGET were placebo-controlled studies and MONARCH was an active comparator-controlled study) in patients older than 18 years with moderately to severely active rheumatoid arthritis diagnosed according to American College of Rheumatology (ACR) criteria. Patients had at least 8 tender and 6 swollen joints at baseline.
Placebo-controlled studies

MOBILITY evaluated 1197 patients with RA who had inadequate clinical response to MTX. Patients received Kevzara 200 mg, Kevzara 150 mg, or placebo every 2 weeks with concomitant MTX. The primary endpoints were the proportion of patients who achieved an ACR20 response at Week 24, changes from baseline in Health Assessment Questionnaire – Disability Index (HAQ-DI) score at Week 16, and change from baseline in van der Heijde-modified Total Sharp Score (mTSS) at Week 52.

TARGET evaluated 546 patients with RA who had an inadequate clinical response or were intolerant to one or more TNF-α antagonists. Patients received Kevzara 200 mg, Kevzara 150 mg, or placebo every 2 weeks with concomitant conventional DMARDs (cDMARDs). The primary endpoints were the proportion of patients who achieved an ACR20 response at Week 24 and the changes from baseline HAQ-DI score at Week 12.

Clinical response

The percentages of Kevzara + DMARDs-treated patients achieving ACR20, ACR50, and ACR70 responses in MOBILITY and TARGET are shown Table 3. In both studies, patients treated with either 200 mg or 150 mg of Kevzara + DMARDs every two weeks had higher ACR20, ACR50, and ACR70 response rates versus placebo-treated patients at Week 24. These responses persisted through 3 years of therapy in an open-label extension study.

In MOBILITY, a greater proportion of patients treated with Kevzara 200 mg or 150 mg every two weeks plus MTX achieved remission, defined as Disease Activity Score 28-C-Reactive Protein (DAS28-CRP) < 2.6 compared with placebo + MTX at Week 52. Results at 24 weeks in TARGET were similar to the results at 52 weeks in MOBILITY (see Table 3).

**Radiographic response**

In MOBILITY, structural joint damage was assessed radiographically and expressed as change in van der Heijde-modified Total Sharp Score (mTSS) and its components, the erosion score, and joint space narrowing score at Week 52. Radiographs of hands and feet were obtained at baseline, 24 weeks, and 52 weeks and scored independently by at least two well-trained readers who were blinded to treatment group and visit number.

Both doses of Kevzara + MTX were superior to placebo + MTX in the change from baseline in mTSS at 24 and 52 weeks (see Table 5). Less progression of both erosion and joint space narrowing scores at 24 and 52 weeks was reported in the sarilumab treatment groups compared to the placebo group.

Treatment with Kevzara + MTX was associated with significantly less radiographic progression of structural damage as compared with placebo. At Week 52, 55.6% of patients receiving Kevzara 200 mg and 47.8% of patients receiving Kevzara 150 mg had no progression of structural damage (as defined by a change in the TSS of zero or less) compared with 38.7% of patients receiving placebo.

Treatment with Kevzara 200 mg and 150 mg + MTX inhibited the progression of structural damage by 91% and 68%, respectively, compared to placebo + MTX at Week 52.

The efficacy of sarilumab with concomitant DMARDs on inhibition of radiographic progression that was assessed as part of the primary endpoints at Week 52 in MOBILITY was sustained up to three years from the start of treatment.

**Physical function response**

In MOBILITY and TARGET, physical function and disability were assessed by the Health Assessment Questionnaire Disability Index (HAQ-DI). Patients receiving Kevzara 200 mg or 150 mg + DMARDs every two weeks demonstrated greater improvement from baseline in physical function compared to placebo at Week 16 and Week 12 in MOBILITY and TARGET, respectively.

MOBILITY demonstrated significant improvement in physical function, as measured by the HAQ-DI at Week 16 compared to placebo (-0.58, -0.54, and -0.30 for Kevzara 200 mg + MTX, Kevzara 150 mg + MTX, and placebo + MTX, every two weeks, respectively). TARGET demonstrated significant improvement in HAQ-DI scores at Week 12 compared to placebo (-0.49, -0.50, and -0.29 for Kevzara 200 mg + DMARDs, Kevzara 150 mg + DMARDs, and placebo + DMARDs, every two weeks, respectively).

In MOBILITY, the improvement in physical functioning as measured by HAQ-DI was maintained up to Week 52 (-0.75, -0.71, and -0.46 for Kevzara 200 mg + MTX, Kevzara 150 mg + MTX, and placebo + MTX treatment groups, respectively).

Patients treated with Kevzara + MTX (47.6% in the 200 mg treatment group and 47.0% in the 150 mg treatment group) achieved a clinically relevant improvement in HAQ-DI (change from baseline of ≥0.3 units) at Week 52 compared to 26.1% in the placebo + MTX treatment group.

**Patient reported outcomes**

General health status was assessed by the Short Form health survey (SF-36). In MOBILITY and TARGET, patients receiving Kevzara 200 mg + DMARDs every two weeks or Kevzara 150 mg + DMARDs every two weeks demonstrated greater improvement from baseline compared to placebo + DMARDs in physical component summary (PCS) and no worsening on the mental component summary (MCS) at Week 24. Patients receiving Kevzara 200 mg + DMARDs reported greater improvement relative to placebo in the domains of Physical Functioning, Role Physical, Bodily Pain, General Health Perception, Vitality, Social Functioning, and Mental Health.

Fatigue was assessed by the FACIT-Fatigue scale. In MOBILITY and TARGET, patients receiving sarilumab 200 mg + DMARDs every two weeks or sarilumab 150 mg + DMARDs every two weeks demonstrated greater improvement from baseline compared to placebo + DMARDs.
**Active Comparator-controlled Study**

MONARCH was a 24-week randomised double-blind, double-dummy study that compared Kevzara 200 mg monotherapy with adalimumab 40 mg monotherapy administered subcutaneously every two weeks in 369 patients with moderately to severely active RA who were inappropriate for treatment with MTX including those who were intolerant of or inadequate responders to MTX.

Kevzara 200 mg was superior to adalimumab 40 mg in reducing disease activity and improving physical function, with more patients achieving clinical remission over 24 weeks (see Table 6).

*Includes patients who increased the frequency of dosing of adalimumab 40 mg to every week because of an inadequate response

**Paediatric population**

The European Medicines Agency has deferred the obligation to submit the results of studies with Kevzara (sarilumab) in one or more subsets of the paediatric population in chronic idiopathic arthritis (including rheumatoid arthritis, spondylarthritis, psoriatic arthritis and juvenile idiopathic arthritis) (see section 4.2 for information on paediatric use).

**5.2 Pharmacokinetic properties**

The pharmacokinetics of sarilumab were characterised in 2186 patients with RA treated with sarilumab which included 751 patients treated with 150 mg and 891 patients treated with 200 mg subcutaneous doses every two weeks for up to 52 weeks.

**Absorption**

The absolute bioavailability for sarilumab after SC injection was estimated to be 80% by population PK analysis. The median \( t_{\text{max}} \) after a single subcutaneous dose was observed in 2 to 4 days. After multiple dosing of 150 to 200 mg every two weeks, steady state was reached in 12 to 16 weeks with a 2- to 3-fold accumulation compared to single dose exposure.

For the 150 mg every two weeks dose regimen, the estimated mean (± standard deviation, SD) steady-state area under curve (AUC), \( C_{\text{min}} \), and \( C_{\text{max}} \) of sarilumab were 210 ± 115 mg.day/L, 6.95 ± 7.60 mg/L, and 20.4 ± 8.27 mg/L, respectively.

For the 200 mg every two weeks dose regimen, the estimated mean (± SD) steady-state AUC, \( C_{\text{min}} \) and \( C_{\text{max}} \) of sarilumab were 396 ± 194 mg.day/L, 16.7 ± 13.5 mg/L, and 35.4 ± 13.9 mg/L, respectively. In a usability study sarilumab exposure after 200 mg Q2W was slightly higher (\( C_{\text{max}} \) + 24-34%, \( \text{AUC}_{(0-2w)} \) + 7-21%) after use of a pre-filled pen compared to the pre-filled syringe.
Distribution
In patients with RA, the apparent volume of distribution at steady state was 8.3 L.

Biotransformation
The metabolic pathway of sarilumab has not been characterised. As a monoclonal antibody sarilumab is expected to be degraded into small peptides and amino acids via catabolic pathways in the same manner as endogenous IgG.

Elimination
Sarilumab is eliminated by parallel linear and non-linear pathways. At higher concentrations, the elimination is predominantly through the linear, non-saturable proteolytic pathway, while at lower concentrations, non-linear saturable target-mediated elimination predominates. These parallel elimination pathways result in an initial half-life of 8 to 10 days, and at steady-state an effective half-life of 21 days is estimated.

After the last steady state dose of 150 mg and 200 mg sarilumab, the median times to non-detectable concentration are 30 and 49 days, respectively. Monoclonal antibodies are not eliminated via renal or hepatic pathways.

Linearity/non-linearity
A more than dose-proportional increase in pharmacokinetic exposure was observed in patients with RA. At steady state, exposure over the dosing interval measured by AUC increased approximately 2-fold with a 1.33-fold increase in dose from 150 to 200 mg every two weeks.

Interactions with CYP450 substrates
Simvastatin is a CYP3A4 and OATP1B1 substrate. In 17 patients with RA, one week following a single 200-mg subcutaneous administration of sarilumab, exposure of simvastatin and simvastatin acid decreased by 45% and 36%, respectively (see section 4.5).

Special populations
Age, gender, ethnicity and body weight
Population pharmacokinetic analyses in adult patients with RA (ranging in age from 18 to 88 years with 14% over 65 years) showed that age, gender and race did not meaningfully influence the pharmacokinetics of sarilumab.

Body weight influenced the pharmacokinetics of sarilumab. In patients with higher body weight (>100 Kg) both 150 mg and 200 mg doses demonstrated efficacy; however, patients weighing >100 Kg had greater therapeutic benefit with the 200 mg dose.

Renal impairment
No formal study of the effect of renal impairment on the pharmacokinetics of sarilumab was conducted. Mild to moderate renal impairment did not affect the pharmacokinetics of sarilumab. No dosage adjustment is required in patients with mild to moderate renal impairment. Patients with severe renal impairment were not studied.

Hepatic impairment
No formal study of the effect of hepatic impairment on the pharmacokinetics of sarilumab was conducted (see section 4.2).

5.3 Preclinical safety data
Non-clinical data reveal no special hazard for humans based on repeated-dose toxicity studies, carcinogenic risk assessment and reproductive and developmental toxicity studies.

No long-term animal studies have been performed to establish the carcinogenicity potential of sarilumab. The weight of evidence for IL-6Ra inhibition mainly indicates anti-tumour effects mediated by multiple mechanisms predominantly involving STAT-3 inhibition. In vitro and in vivo
studies with sarilumab using human tumour cell lines showed inhibition of STAT-3 activation and inhibition of tumour growth in human tumour xenograft animal models.

Fertility studies conducted in male and female mice using a murine surrogate antibody against mouse IL-6Rα showed no impairment of fertility.

In an enhanced pre-/postnatal developmental toxicity study, pregnant Cynomolgus monkeys were administered sarilumab once-weekly intravenously from early gestation to natural birth (approximately 21 weeks) Maternal exposure up to approximately 83 times the human exposure based on AUC after subcutaneous doses of 200 mg every 2 weeks, did not cause any maternal or embryo-fetal effects. Sarilumab had no effect on maintenance of pregnancy or on the neonates evaluated up to 1 month after birth in body weight measurements, in parameters of functional or morphological development including skeletal evaluations, in immunophenotyping of peripheral blood lymphocytes, and in microscopic evaluations. Sarilumab was detected in the serum of neonates up to 1 month. The excretion of sarilumab in Cynomolgus monkey’s milk has not been studied.

6. PHARMACEUTICAL PARTICULARS

6.1 List of excipients

Histidine
Arginine
Polysorbate 20
Sucrose
Water for injections

6.2 Incompatibilities

In the absence of compatibility studies, this medicinal product must not be mixed with other medicinal products.

6.3 Shelf life

36 months.

Once removed from the refrigerator, Kevzara should be administered within 14 days and should not be stored above 25 ºC.

6.4 Special precautions for storage

Store in a refrigerator (2ºC - 8ºC). Do not freeze.

Store pre-filled syringe/pre-filled pen in the original carton in order to protect from light.

6.5 Nature and contents of container

All presentations contain a 1.14 ml solution in a syringe (type 1 glass) equipped with a stainless steel staked needle and an elastomer plunger stopper.

Pre-filled syringe 150 mg:
The single-use pre-filled syringe has a styrene-butadiene elastomer needle cap and is equipped with a white polystyrene plunger rod and a light-orange polypropylene finger flange.
Pre-filled syringe 200 mg:
The single-use pre-filled syringe has a styrene-butadiene elastomer needle cap and is equipped with a white polystyrene plunger rod and a dark-orange polypropylene finger flange.

Pre-filled pen 150 mg:
The syringe components are pre-assembled into a single-use pre-filled pen with a yellow needle cover and light-orange cap.

Pre-filled pen 200 mg:
The syringe components are pre-assembled into a single-use pre-filled pen with a yellow needle cover and dark-orange cap.

Pack sizes:
- 1 pre-filled syringe
- 2 pre-filled syringes
- Multipack containing 6 (3 packs of 2) pre-filled syringes
- 1 pre-filled pen
- 2 pre-filled pens
- Multipack containing 6 (3 packs of 2) pre-filled pens

Not all pack sizes may be marketed.

6.6 Special precautions for disposal and other handling

The pre-filled syringe/pre-filled pen should be inspected before use. The solution should not be used if it is cloudy, discoloured, or contains particles, or if any part of the device appears to be damaged.

After removing the pre-filled syringe/pre-filled pen from the refrigerator, it should be allowed to reach room temperature (<25°C) before injecting Kevzara.

Comprehensive instructions for the administration of Kevzara in a pre-filled syringe/pre-filled pen are given in the package leaflet.

Any unused medicinal product or waste material should be disposed of in accordance with local requirements. After use, place the pre-filled syringe/ pre-filled pen into a puncture-resistant container and discard as required by local regulations. Do not recycle the container. Keep the container out of sight and reach of children.

The printed package leaflet of the medicinal product must state the name and address of the manufacturer responsible for the release of the concerned batch.

B. CONDITIONS OR RESTRICTIONS REGARDING SUPPLY AND USE

Medicinal product subject to restricted medical prescription (see Annex I: Summary of Product Characteristics, section 4.2).

C. OTHER CONDITIONS AND REQUIREMENTS OF THE MARKETING AUTHORIZATION

- Periodic safety update reports

The requirements for submission of periodic safety update reports for this medicinal product are set out in the list of Union reference dates (EURD list) provided for under Article 107c(7) of Directive 2001/83/EC and any subsequent updates published on the European medicines web-portal.

The marketing authorisation holder shall submit the first periodic safety update report for this product within 6 months following authorisation.

D. CONDITIONS OR RESTRICTIONS WITH REGARD TO THE SAFE AND EFFECTIVE USE OF THE MEDICINAL PRODUCT

- Risk Management Plan (RMP)

The MAH shall perform the required pharmacovigilance activities and interventions detailed in the
agreed RMP presented in Module 1.8.2 of the marketing authorisation and any agreed subsequent updates of the RMP.

An updated RMP should be submitted:

- At the request of the European Medicines Agency;
- Whenever the risk management system is modified, especially as the result of new information being received that may lead to a significant change to the benefit/risk profile or as the result of an important (pharmacovigilance or risk minimisation) milestone being reached.

**Additional risk minimisation measures**

Prior to launch of Kevzara in each Member State the Marketing Authorisation Holder (MAH) must agree about the content and format of patient alert card, including communication media, distribution modalities, and any other aspects, with the National Competent Authority.

The MAH shall ensure that in each Member State where Kevzara is marketed, all healthcare professionals who are expected to prescribe Kevzara have access to the patient alert card.

**The patient alert card** shall contain the following key messages:

- A warning message for HCPs treating the patient at any time, including in conditions of emergency, that the patient is using Kevzara.
- That Kevzara treatment may increase the risks of serious infections, neutropenia and intestinal perforation.
- Educate patients on signs or symptoms that could represent serious infections or gastrointestinal perforations to seek for medical attention immediately.
- Contact details of the prescriber for Kevzara.

B. PACKAGE LEAFLET
Package leaflet: Information for the patient

Kevzara 150 mg solution for injection in pre-filled syringe
Kevzara 200 mg solution for injection in pre-filled syringe
Sarilumab

This medicine is subject to additional monitoring. This will allow quick identification of new safety information. You can help by reporting any side effects you may get. See the end of section 4 for how to report side effects.

Read all of this leaflet carefully before you start using this medicine because it contains important information for you.

- Keep this leaflet. You may need to read it again.
- If you have any further questions, ask your doctor, pharmacist, or nurse.
- This medicine has been prescribed for you only. Do not pass it on to others. It may harm them, even if their signs of illness are the same as yours.
- If you get any side effects, talk to your doctor, pharmacist, or nurse. This includes any possible side effects not listed in this leaflet. See section 4.

In addition to this leaflet, you will be given a patient alert card, which contains important safety information that you need before and during treatment with Kevzara.

What is in this leaflet
1. What Kevzara is and what it is used for
2. What you need to know before you use Kevzara
3. How to use Kevzara
4. Possible side effects
5. How to store Kevzara
6. Contents of the pack and other information

1. What Kevzara is and what it is used for

What Kevzara is
Kevzara contains the active substance sarilumab. It is a type of protein called a monoclonal antibody.

What Kevzara is used for
Kevzara is used to treat adults with moderately to severely active rheumatoid arthritis if previous therapy did not work well enough or was not tolerated. Kevzara can be used alone or together with a medicine called methotrexate.

It may help you by:
- slowing down damage to joints
- improving your ability to perform daily activities.

How Kevzara works
- Kevzara attaches to another protein called interleukin-6 (IL-6) receptor and blocks its action.
- IL-6 plays a major role in the symptoms of rheumatoid arthritis such as pain, swollen joints, morning stiffness, and fatigue.

2. What you need to know before you use Kevzara

Do not use Kevzara:
- if you are allergic to sarilumab or any of the other ingredients of this medicine (listed in section 6).
- if you have an active severe infection.
Warnings and precautions
Talk to your doctor, pharmacist, or nurse if:

- you have any infection or you get a lot of infections. Kevzara can lower your body's ability to fight infection: this means it can make you more likely to get infections or make your infection worse.
- you have tuberculosis (TB), symptoms of TB (persistent cough, weight loss, listlessness, mild fever), or have been in close contact with someone with TB. Before you are given Kevzara, your doctor will check you for TB.
- you have had viral hepatitis or other liver disease. Before you use Kevzara, your doctor will do a blood test to check your liver function.
- you have had diverticulitis (a condition of the lower bowel) or ulcers in your stomach or intestines, or develop symptoms such as fever and stomach (abdominal) pain that does not go away.
- you have ever had any type of cancer.
- you have recently had any vaccination or are going to have a vaccination.

If any of the above apply to you (or you are not sure), talk to your doctor, pharmacist or nurse before using Kevzara.

You will have blood tests before you are given Kevzara. You will also have the tests during your treatment. This is to check for low blood cell count, liver problems, or changes in your cholesterol levels.

Children and adolescents
Kevzara is not recommended in children and adolescents under 18 years of age.

Other medicines and Kevzara
Tell your doctor or pharmacist if you are using, have recently used, or might use any other medicines. This is because Kevzara can affect the way some other medicines work. Also some other medicines can affect the way Kevzara works.

In particular, do not use Kevzara and tell your doctor or pharmacist if you are using:

- a group of medicines called “Janus kinase (JAK) inhibitors” (used for diseases like rheumatoid arthritis and cancer)
- other biological medicines used in the treatment of rheumatoid arthritis

If any of the above apply to you (or you are not sure), talk to your doctor or pharmacist.

Kevzara can affect the way some medicines work: this means the dose of other medicines may need changing. If you are using any of the following medicines, tell your doctor or pharmacist before using Kevzara:

- statins, used to reduce cholesterol level
- oral contraceptives
- theophylline, used to treat asthma
- warfarin, used to prevent blood clots.

If any of the above apply to you (or you are not sure), talk to your doctor or pharmacist.

Pregnancy and breast-feeding
Talk to your doctor before using Kevzara if you are pregnant or breast-feeding, think you may be pregnant or are planning to have a baby.

- Do not take Kevzara if you are pregnant unless your doctor specifically recommends it.
- The effects of Kevzara on an unborn baby are not known.
- You and your doctor should decide if you should use Kevzara if you are breast-feeding.
Driving and using machines
The use of Kevzara is not expected to affect your ability to drive or use machines. However, if you are feeling tired or unwell after you use Kevzara, you should not drive or use machines.

3. How to use Kevzara

Treatment should be started by a doctor experienced in the diagnosis and treatment of rheumatoid arthritis. Always use this medicine exactly as your doctor or pharmacist has told you. Check with your doctor or pharmacist if you are not sure.

Kevzara is given as an injection under the skin (called “subcutaneous” injection).

The recommended dose is one 200 mg injection every two weeks.
- Your doctor may adjust the dose of your medicine based on results of blood tests.

Learning how to use the pre-filled syringe
- Your doctor, pharmacist, or nurse will show you how to inject Kevzara. Following these instructions, Kevzara can be self-injected or administered by a care-giver.
- Carefully follow the “Instructions for Use” provided in the carton.
- Use the pre-filled syringe exactly as described in the “Instructions for Use”.

If you use more Kevzara than you should
If you have used more Kevzara than you should, talk to your doctor, pharmacist or nurse.

If you miss a dose of Kevzara
If it has been 3 days or less since the missed dose:
- inject your missed dose as soon as you can.
- then inject your next dose at your regular time.

If it has been 4 days or more, inject the next dose at your regular time. Do not inject a double dose to make up for a forgotten injection.

If you are unsure when to inject your next dose: ask your doctor, pharmacist or nurse for instructions.

If you stop using Kevzara
Do not stop using Kevzara without talking to your doctor.

If you have any further questions on the use of this medicine, ask your doctor, pharmacist, or nurse.

4. Possible side effects

Like all medicines, this medicine can cause side effects, although not everybody gets them.

Serious side effect
Tell your doctor straight away if you think you have an infection (which may affect up to 1 in every 10 people). The symptoms may include fever, sweats, or chills.

Other side effects
Tell your doctor, pharmacist, or nurse if you notice any of the following side effects:

Very Common (may affect more than 1 in 10 people):
- Low white blood cell counts shown by blood tests

Common (may affect up to 1 in 10 people):
- infections in your sinuses or throat, blocked or runny nose and sore throat (upper respiratory tract infection)
- urinary tract infection
- cold sores (oral herpes)
- low platelet counts shown by blood tests
- high cholesterol, high triglycerides shown by blood tests
- abnormal liver function tests
- injection-site reactions (including redness and itching).

Uncommon (may affect up to 1 in 100 people):
- infection of the lungs
- inflammation of the deep skin tissue
- diverticulitis (a disease affecting the gut often with stomach (abdominal) pain, nausea and vomiting, fever, and constipation, or less commonly diarrhoea)

Rare (may affect up to 1 in 1000 people):
- perforation in stomach or intestines (a hole that develops in the wall of the gut)

Reporting of side effects
If you get any side effects, talk to your doctor, pharmacist, or nurse. This includes any possible side effects not listed in this leaflet. You can also report side effects directly via the national reporting system listed in Appendix V. By reporting side effects you can help provide more information on the safety of this medicine.

5. How to store Kevzara
Keep this medicine out of the sight and reach of children.

Do not use this medicine after the expiry date which is stated on the label after EXP. The expiry date refers to the last day of that month.

Store in a refrigerator (2°C to 8°C).
- Do not freeze or heat the syringe.
- Once taken out of the refrigerator, do not store Kevzara above 25 °C.
- Write down the date of removal from the refrigerator in the space provided on the outer carton.
- Use the syringe within 14 days after taking it out of the refrigerator or the insulated bag.
- Keep the syringe in the original carton in order to protect it from light.

Do not use this medicine if the solution in the syringe is cloudy, discoloured or contains particles, or if any part of the pre-filled syringe looks damaged.

After use, put the syringe into a puncture-resistant container. Always keep the container out of the sight and reach of children. Ask your doctor, pharmacist, or nurse how to throw away the container. Do not recycle the container.

Do not throw away any medicines via wastewater or household waste. Ask your pharmacist how to throw away medicines you no longer use. These measures will help protect the environment.

6. Contents of the pack and other information

What Kevzara contains
The active substance is sarilumab.
The other ingredients are arginine, histidine, polysorbate 20, sucrose, and water for injections.

What Kevzara looks like and contents of the pack
Kevzara is a clear, colourless to pale yellow solution for injection that comes in a pre-filled syringe.

Each pre-filled syringe contains 1.14 ml of solution delivering one single dose. It is available in pack sizes of 1 or 2 or a multipack of 6 pre-filled syringes (3 packs of 2).

Not all pack sizes may be marketed.

Kevzara is available as 150 mg or 200 mg pre-filled syringes.

---------------------------------------------------------------
Kevzara 150 mg solution for injection in a pre-filled syringe
sarilumab

Instructions for use

The parts of the Kevzara pre-filled syringe are shown in this picture.

Important information

This device is a single-dose pre-filled syringe (called “syringe” in these instructions). It contains 150 mg of Kevzara for injection under the skin (subcutaneous injection) once every two weeks.

Ask your healthcare professional to show you the right way to use the syringe before your first injection.

Do

✓ Read all of the instructions carefully before using a syringe.
✓ Check that you have the correct medicine and the correct dose.
✓ Keep unused syringes in the original carton and store in the refrigerator between 2°C and 8°C.
✓ Keep the carton in an insulated bag with an ice pack when travelling.
✓ Let the syringe warm up to room temperature for at least 30 minutes before using.
✓ Use the syringe within 14 days after taking it out of the refrigerator or insulated bag.
✓ Keep the syringe out of the sight and reach of children.
Do not
- Do not use the syringe if it has been damaged or the needle cap is missing or not attached.
- Do not remove the needle cap until just before you are ready to inject.
- Do not touch the needle.
- Do not try to put the cap back on the syringe.
- Do not re-use the syringe.
- Do not freeze or heat the syringe.
- Once removed from the refrigerator, do not store the syringe above 25°C.
- Do not expose the syringe to direct sunlight.
- Do not inject through your clothes.

If you have any further questions, ask your doctor, pharmacist or nurse or call the sanofi number on the package leaflet.

Step A: Get ready for an injection

1. Prepare all the equipment you will need on a clean, flat working surface.
   - You will need an alcohol wipe, a cotton ball or gauze, and a puncture-resistant container.
   - Take one syringe out of the packaging by holding the middle of the syringe body. Keep the remaining syringe in the carton in the refrigerator.

2. Look at the label.
   - Check that you have the correct medicine and the correct dose.
   - Check the expiry date (EXP).
   - **Do not** use the syringe if the date has passed.

3. Look at the medicine.
   - Check that the liquid is clear and colourless to pale yellow.
   - You may see an air bubble, this is normal.
   - **Do not** inject if the liquid is cloudy, discoloured or contains particles.
4. Lay the syringe on a flat surface and allow it to warm up to room temperature (<25°C) for at least 30 minutes.
   - Using the syringe at room temperature may make the injection more comfortable.
   - **Do not** use the syringe if it has been out of the refrigerator for more than 14 days.
   - **Do not** heat the syringe; let it warm up on its own.
   - **Do not** expose the syringe to direct sunlight.

![Syringe warming up](image)

5. Select the injection site.
   - You can inject into your thigh or belly (abdomen) except for the 5 cm around your belly button (navel). If somebody else gives you the injection, you can also use the outer area of the upper arm.
   - Change injection site each time you inject.
   - **Do not** inject into skin that is tender, damaged or has bruises or scars.

![Injection sites](image)

6. Prepare the injection site.
   - Wash your hands.
   - Clean skin with an alcohol wipe.
   - **Do not** touch the injection site again before the injection.

**Step B: Perform the injection – Perform Step B only after completing Step A “Get ready for an injection”**

1. Pull off the needle cap.
   - Hold the syringe in the middle of the syringe body with the needle pointing away from you.
   - Keep your hand away from the plunger.
   - **Do not** get rid of any air bubbles in the syringe.
\textbf{Do not} pull off the needle cap until you are ready to inject.\n\textbf{Do not} put the needle cap back on.

2. Pinch the skin.
   - Use your thumb and first (index) finger to pinch a fold of skin at the injection site.

3. Insert the needle into the fold of skin at roughly a 45º angle.

4. Push the plunger down.
   - Slowly push the plunger down as far as it will go until the syringe is empty.
5. Before you remove the needle, check that the syringe is empty.
   - Pull the needle out at the same angle it was injected.
   - If you see any blood, press a cotton ball or gauze on the site.
   ✗ Do not rub your skin after the injection.

6. Put your used syringe and the cap into a puncture-resistant container right away after use.
   - Always keep the container out of the sight and reach of children.
   ✗ Do not put the needle cap back on.
   ✗ Do not throw the used syringe in household waste.
   ✗ Do not recycle your used puncture-resistant container.
   ✗ Do not dispose of your used puncture-resistant container in your household waste unless your local guidelines permit this. Ask your doctor, pharmacist or nurse how to throw away the container.
Instructions for use

The parts of the Kevzara pre-filled syringe are shown in this picture.

Important information

This device is a single-dose pre-filled syringe (called “syringe” in these instructions). It contains 200 mg of Kevzara for injection under the skin (subcutaneous injection) once every two weeks.

Ask your healthcare professional to show you the right way to use the syringe before your first injection.

Do
✓ Read all of the instructions carefully before using a syringe.
✓ Check that you have the correct medicine and the correct dose.
✓ Keep unused syringes in the original carton and store in the refrigerator between 2°C and 8°C.
✓ Keep the carton in an insulated bag with an ice pack when travelling.
✓ Let the syringe warm up to room temperature for at least 30 minutes before using.
✓ Use the syringe within 14 days after taking it out of the refrigerator or insulated bag.
✓ Keep the syringe out of the sight and reach of children.
Do not
X Do not use the syringe if it has been damaged or the needle cap is missing or not attached.
X Do not remove the needle cap until just before you are ready to inject.
X Do not touch the needle.
X Do not try to put the cap back on the syringe.
X Do not re-use the syringe.
X Do not freeze or heat the syringe.
X Once removed from the refrigerator, do not store the syringe above 25°C.
X Do not expose the syringe to direct sunlight.
X Do not inject through your clothes.

If you have any further questions, ask your doctor, pharmacist or nurse or call the sanofi number on the package leaflet.

Step A: Get ready for an injection

1. Prepare all the equipment you will need on a clean, flat working surface.
   • You will need an alcohol wipe, a cotton ball or gauze, and a puncture-resistant container.
   • Take one syringe out of the packaging by holding the middle of the syringe body. Keep the remaining syringe in the carton in the refrigerator.

2. Look at the label.
   • Check that you have the correct medicine and the correct dose.
   • Check the expiry date (EXP).
     X Do not use the syringe if the date has passed.

3. Look at the medicine.
   • Check that the liquid is clear and colourless to pale yellow.
   • You may see an air bubble, this is normal.
     X Do not inject if the liquid is cloudy, discoloured or contains particles.
4. Lay the syringe on a flat surface and allow it to warm up to room temperature (<25°C) for at least 30 minutes.
   - Using the syringe at room temperature may make the injection more comfortable.
   - **Do not** use the syringe if it has been out of the refrigerator for more than 14 days.
   - **Do not** heat the syringe; let it warm up on its own.
   - **Do not** expose the syringe to direct sunlight.

![Syringe and clock](image)

5. Select the injection site.
   - You can inject into your thigh or belly (abdomen) except for the 5 cm around your belly button (navel). If somebody else gives you the injection, you can also use the outer area of the upper arm.
   - Change injection site each time you inject.
   - **Do not** inject into skin that is tender, damaged or has bruises or scars.

![Injection sites](image)

6. Prepare the injection site.
   - Wash your hands.
   - Clean skin with an alcohol wipe.
   - **Do not** touch the injection site again before the injection.

**Step B: Perform the injection – Perform Step B only after completing Step A “Get ready for an injection”**

1. Pull off the needle cap.
   - Hold the syringe in the middle of the syringe body with the needle pointing away from you.
Keep your hand away from the plunger.

Do not get rid of any air bubbles in the syringe.

Do not pull off the needle cap until you are ready to inject.

Do not put the needle cap back on.

2. Pinch the skin.
   - Use your thumb and first (index) finger to pinch a fold of skin at the injection site.

3. Insert the needle into the fold of skin at roughly a 45° angle.

4. Push the plunger down.
• Slowly push the plunger down as far as it will go until the syringe is empty.

5. Before you remove the needle, check that the syringe is empty.
• Pull the needle out at the same angle it was injected.
• If you see any blood, press a cotton ball or gauze on the site.
  ✗ Do not rub your skin after the injection.

6. Put your used syringe and the cap into a puncture-resistant container right away after use.
• Always keep the container out of the sight and reach of children.
  ✗ Do not put the needle cap back on.
  ✗ Do not throw the used syringe in household waste.
  ✗ Do not recycle your used puncture-resistant container.
  ✗ Do not dispose of your used puncture-resistant container in your household waste unless your local guidelines permit this. Ask your doctor, pharmacist or nurse how to throw away the container.
This medicine is subject to additional monitoring. This will allow quick identification of new safety information. You can help by reporting any side effects you may get. See the end of section 4 for how to report side effects.

Read all of this leaflet carefully before you start using this medicine because it contains important information for you.

- Keep this leaflet. You may need to read it again.
- If you have any further questions, ask your doctor, pharmacist, or nurse.
- This medicine has been prescribed for you only. Do not pass it on to others. It may harm them, even if their signs of illness are the same as yours.
- If you get any side effects, talk to your doctor, pharmacist, or nurse. This includes any possible side effects not listed in this leaflet. See section 4.

In addition to this leaflet, you will be given a patient alert card, which contains important safety information that you need before and during treatment with Kevzara.

What is in this leaflet
1. What Kevzara is and what it is used for
2. What you need to know before you use Kevzara
3. How to use Kevzara
4. Possible side effects
5. How to store Kevzara
6. Contents of the pack and other information

1. What Kevzara is and what it is used for

What Kevzara is
Kevzara contains the active substance sarilumab. It is a type of protein - called a “monoclonal antibody”.

What Kevzara is used for
Kevzara is used to treat adults with moderately to severely active rheumatoid arthritis if previous therapy did not work well enough or was not tolerated. Kevzara can be used alone or together with a medicine called methotrexate.
It may help you by:
- slowing down damage to joints
- improving your ability to perform daily activities.

How Kevzara works
- Kevzara attaches to another protein called interleukin-6 (IL-6) receptor and blocks its action.
- IL-6 plays a major role in the symptoms of rheumatoid arthritis such as pain, swollen joints, morning stiffness, and fatigue.
2. What you need to know before you use Kevzara

Do not use Kevzara:
- if you are allergic to sarilumab or any of the other ingredients of this medicine (listed in section 6).
- if you have an active severe infection.

Warnings and precautions
Talk to your doctor, pharmacist, or nurse if:
- you have any infection or, you get a lot of infections. Kevzara can lower your body's ability to fight infection and this means it can make you more likely to get infections or make your infection worse.
- you have tuberculosis (TB), symptoms of TB (persistent cough, weight loss, listlessness, mild fever), or have been in close contact with someone with TB. Before you are given Kevzara, your doctor will check you for TB.
- you have had viral hepatitis or other liver disease. Before you use Kevzara, your doctor will do a blood test to check your liver function.
- you have had diverticulitis (a condition of the lower bowel) or ulcers in your stomach or intestines, or develop symptoms such as fever and stomach (abdominal) pain that does not go away.
- you have ever had any type of cancer.
- you have recently had any vaccination or are going to have a vaccination.

If any of the above apply to you (or you are not sure), talk to your doctor, pharmacist or nurse before using Kevzara.

You will have blood tests before you are given Kevzara. You will also have the tests during your treatment. This is to check if you have a low blood cell count, liver problems, or changes in your cholesterol levels.

Children and adolescents
Kevzara is not recommended in children and adolescents under 18 years of age.

Other medicines and Kevzara
Tell your doctor or pharmacist if you are using, have recently used, or might use any other medicines. This is because Kevzara can affect the way some other medicines work. Also some other medicines can affect the way Kevzara works.

In particular, do not use Kevzara and tell your doctor or pharmacist if you are using:
- a group of medicines called “Janus kinase (JAK) inhibitors” (used for disease like rheumatoid arthritis and cancer)
- other biological medicines used in the treatment of rheumatoid arthritis.

If any of the above apply to you (or you are not sure), talk to your doctor or pharmacist.

Kevzara can affect the way some medicines work: this means the dose of other medicines may need changing. If you are using any of the following medicines, tell your doctor or pharmacist before using Kevzara:
- statins, used to reduce cholesterol level
- oral contraceptives
- theophylline, used to treat asthma
- warfarin, used to prevent blood clots

If any of the above apply to you (or you are not sure), talk to your doctor or pharmacist.

Pregnancy and breast-feeding
Talk to your doctor before using Kevzara if you are pregnant or breast feeding, think you may be pregnant or are planning to have a baby.
• Do not take Kevzara if you are pregnant – unless your doctor specifically recommends it.
• The effects of Kevzara on an unborn baby are not known.
• You and your doctor should decide if you should use Kevzara if you are breast-feeding.

Driving and using machines
The use of Kevzara is not expected to affect your ability to drive or use machines. However, if you are feeling tired or unwell after you use Kevzara, you should not drive or use machines.

3. How to use Kevzara

Treatment should be started by a doctor experienced in the diagnosis and treatment of rheumatoid arthritis. Always use this medicine exactly as your doctor or pharmacist has told you. Check with your doctor or pharmacist if you are not sure.

Kevzara is given as an injection under the skin (called “subcutaneous” injection).

The recommended dose is one 200 mg injection every two weeks.
• Your doctor may adjust the dose of your medicine based on results of blood tests.

Learning how to use the pre-filled pen
• Your doctor, pharmacist, or nurse will show you how to inject Kevzara. Following these instructions Kevzara can be self-injected or administered by a care-giver.
• Carefully follow the “Instructions for Use” provided in the carton.
• Use the pre-filled pen exactly as described in the “Instructions for Use”.

If you use more Kevzara than you should
If you have used more Kevzara than you should, talk to your doctor, pharmacist or nurse.

If you miss a dose of Kevzara
If it has been 3 days or less since the missed dose:
• inject your missed dose as soon as you can.
• then inject your next dose at your regular time.

If it has been 4 days or more, inject the next dose at your regular time. Do not inject a double dose to make up for a forgotten injection.
If you are unsure when to inject your next dose: ask your doctor, pharmacist or nurse for instructions.

If you stop using Kevzara
Do not stop using Kevzara without talking to your doctor.

If you have any further questions on the use of this medicine, ask your doctor, pharmacist, or nurse.

4. Possible side effects

Like all medicines, this medicine can cause side effects, although not everybody gets them.

Serious side effect
Tell your doctor straight away if you think you have an infection (which may affect up to 1 in every 10 people). The symptoms may include fever, sweats, or chills.

Other side effects
Tell your doctor, pharmacist, or nurse if you notice any of the following side effects:
Very Common (may affect more than 1 in 10 people):
• Low white blood cell counts shown by blood tests
Common (may affect up to 1 in 10 people):
- infections in your sinuses or throat, blocked or runny nose and sore throat (“upper respiratory tract infection”)
- urinary tract infection
- cold sores (“oral herpes”)
- low platelet counts shown by blood tests
- high cholesterol, high triglycerides shown by blood tests
- abnormal liver function tests
- injection site reactions (including redness and itching)

Uncommon (may affect up to 1 in 100 people):
- infection of the lungs
- inflammation of the deep skin tissue
- diverticulitis (a disease affecting the gut often with stomach (abdominal) pain, nausea and vomiting, fever, and constipation, or less commonly diarrhoea)

Rare (may affect up to 1 in 1000 people):
- perforation in stomach or intestines (a hole that develops in the wall of the gut)

Reporting of side effects
If you get any side effects, talk to your doctor, pharmacist, or nurse. This includes any possible side effects not listed in this leaflet. You can also report side effects directly via the national reporting system listed in Appendix V. By reporting side effects you can help provide more information on the safety of this medicine.

5. How to store Kevzara

Keep this medicine out of the sight and reach of children.

Do not use this medicine after the expiry date which is stated on the label after EXP. The expiry date refers to the last day of that month.

Store in a refrigerator (2°C to 8°C).
- Do not freeze or heat the pen.
- Once taken out the refrigerator, do not store Kevzara above 25 °C.
- Write down the date of removal from the refrigerator in the space provided on the outer carton.
- Use the pen within 14 days after taking it out of the refrigerator or the insulated bag.
- Keep the pen in the original carton in order to protect it from light.

Do not use this medicine if the solution in the pen is cloudy, discoloured or contains particles, or if any part of the pre-filled pen looks damaged.

After use, put the pen into a puncture-resistant container. Always keep the container out of the sight and reach of children. Ask your doctor, pharmacist, or nurse how to throw away the container. Do not recycle the container.

Do not throw away any medicines via wastewater or household waste. Ask your pharmacist how to throw away medicines you no longer use. These measures will help protect the environment.

6. Contents of the pack and other information

What Kevzara contains
The active substance is sarilumab.
The other ingredients are arginine, histidine, polysorbate 20, sucrose, and water for injections.

What Kevzara looks like and contents of the pack
Kevzara is a clear, colourless to pale yellow solution for injection that comes in a pre-filled pen.

Each pre-filled pen contains 1.14 ml of solution delivering one single dose. It is available in pack sizes of 1 or 2 or a multipack of 6 pre-filled pens (3 packs of 2).

Not all pack sizes may be marketed.

Kevzara is available as 150 mg or 200 mg pre-filled pens.

Detailed information on this medicine is available on the European Medicines Agency web site:

---------------------------------------------------------------------------------------------------------------------------
The parts of the Kevzara pre-filled pen are shown in this picture.

Important information

This device is a single-dose pre-filled pen (called “pen” in these instructions). It contains 150 mg of Kevzara for injection under the skin (subcutaneous injection) once every two weeks.

Ask your healthcare professional to show you the right way to use the pen before your first injection.

**Do**

✅ Read all of the instructions carefully before using a pen.
✅ Check that you have the correct medicine and the correct dose.
✅ Keep unused pens in the original carton and store in the refrigerator between 2°C and 8°C.
✅ Keep the carton in an insulated bag with an ice pack when travelling.
✅ Let the pen warm up to room temperature for at least 60 minutes before using.
✅ Use the pen within 14 days after taking it out of the refrigerator or insulated bag.
✅ Keep the pen out of the sight and reach of children.

**Do not**

❌ Do not use a pen if it has been damaged or the cap is missing or not attached.
❌ Do not remove the cap until just before you are ready to inject.
Do not press or touch the yellow needle cover with your fingers.
Do not try to put the cap back on a pen.
Do not re-use the pen.
Do not freeze or heat the pen.
Once removed from the refrigerator, do not store the pen above 25°C.
Do not expose the pen to direct sunlight.
Do not inject through your clothes.

If you have any further questions, ask your doctor, pharmacist or nurse or call the sanofi number on the package leaflet.

Step A: Get ready for an injection

1. Prepare all the equipment you will need on a clean, flat working surface.
   - You will need an alcohol wipe, a cotton ball or gauze, and a puncture-resistant container.
   - Take one pen out of the packaging by holding the middle of the pen body. Keep the remaining pen in the carton in the refrigerator.

2. Look at the label.
   - Check that you have the correct medicine and the correct dose.
   - Check the expiry date (EXP), this is shown on the side of the pens.
   - Do not use the pen if the date has passed.

3. Look at the window.
   - Check that the liquid is clear and colourless to pale yellow.
   - You may see an air bubble, this is normal.
   - Do not inject if the liquid is cloudy, discoloured or contains particles.
   - Do not use if the window is solid yellow.

4. Lay the pen on a flat surface and allow it to warm up to room temperature (<25°C) for at least 60 minutes.
Using the pen at room temperature may make the injection more comfortable.

Do not use the pen if it has been out of the refrigerator for more than 14 days.
Do not heat the pen; let it warm up on its own.
Do not expose the pen to direct sunlight.

5. Select the injection site.
- You can inject into your thigh or belly (abdomen) except for the 5 cm around your belly button (navel). If somebody else gives you the injection, you can also use the outer area of the upper arm.
- Change injection site each time you inject.
Do not inject into skin that is tender, damaged or has bruises or scars.

6. Prepare the injection site.
- Wash your hands.
- Clean skin with an alcohol wipe.
Do not touch the injection site again before the injection.

Step B: Perform the injection – Perform Step B only after completing Step A “Get ready for an injection”

1. Twist or pull off the orange cap.
Do not remove the cap until you are ready to inject.
Do not press or touch the yellow needle cover with your fingers.
Do not put the cap back on.

2. Put the yellow needle cover on your skin at roughly a 90° angle.  
   - Make sure you can see the window.
3. Press down and hold the pen firmly against your skin.
   - There will be a “click” when the injection starts.

4. Keep holding the pen firmly against your skin.
   - The window will start to turn yellow.
   - The injection can take up to 15 seconds.

5. There will be a second click. Check to see if the entire window has turned yellow before you remove the pen.
   - If you do not hear the second click, you should still check to see if the window has turned fully yellow.
   - ✗ If the window does not turn fully yellow, **do not** give yourself a second dose without speaking to your healthcare provider.
6. Pull the pen away from your skin.
   - If you see any blood, press a cotton ball or gauze on the site.
   - **Do not** rub your skin after the injection.

7. Put your used pen and the cap into a puncture-resistant container right away after use.
   - Always keep the container out of the sight and reach of children.
   - **Do not** put the cap back on.
   - **Do not** throw the used pens in household waste.
   - **Do not** recycle your used puncture-resistant container.
   - **Do not** dispose of your used puncture-resistant container in your household waste unless your local guidelines permit this. Ask your doctor, pharmacist or nurse how to throw away the container.

   ❌ Do not recycle your used puncture-resistant container.
   ❌ Do not dispose of your used puncture-resistant container in your household waste unless your local guidelines permit this. Ask your doctor, pharmacist or nurse how to throw away the container.
ANNEX IV

SCIENTIFIC CONCLUSIONS AND GROUNDS FOR THE VARIATION TO THE TERMS OF THE MARKETING AUTHORISATION(S)
Scientific conclusions

Taking into account the PRAC Assessment Report on the PSUR(s) for sarilumab, the scientific conclusions of CHMP are as follows:

In view of available data on leukopenia and diverticulitis from clinical trials and spontaneous reports, including in some cases with a close temporal relationship, a positive de-challenge and in view of a plausible mechanism of action, the PRAC considers a causal relationship between sarilumab and these adverse reactions can be established. The PRAC review concluded that the product information of products containing sarilumab should be amended accordingly.

The CHMP agrees with the scientific conclusions made by the PRAC.

Grounds for the variation to the terms of the marketing authorisation(s)

On the basis of the scientific conclusions for sarilumab the CHMP is of the opinion that the benefit-risk balance of the medicinal product(s) containing sarilumab is unchanged subject to the proposed changes to the product information.

The CHMP recommends that the terms of the marketing authorisation(s) should be varied.
