

ANNEX I
SUMMARY OF PRODUCT CHARACTERISTICS

1. NAME OF THE MEDICINAL PRODUCT

Lutetium (^{177}Lu) chloride Billev 51.8 GBq/mL radiopharmaceutical precursor, solution

2. QUALITATIVE AND QUANTITATIVE COMPOSITION

1 mL solution contains 51.8 GBq lutetium (^{177}Lu) chloride on activity reference time (ART) corresponding to maximum 12.6 micrograms of lutetium (^{177}Lu) (as chloride).

The ART is defined as the end of production. The minimal specific activity is 3000 GBq/mg lutetium (^{177}Lu) at the ART.

Each 5 mL vial contains a volume varying from 0.1 mL to 4 mL corresponding to an activity ranging from 5.2 to 207.2 GBq at ART.

Each 10 mL vial contains a volume varying from 0.1 mL to 8 mL corresponding to an activity ranging from 5.2 to 414.4 GBq at ART.

The activity at the date and time ordered by the customer, indicated as CAL (calibration), is determined by the time elapsed from the ART and the half-life of lutetium (^{177}Lu).

Lutetium (^{177}Lu) has a half-life of 6.7 days. Lutetium (^{177}Lu) non carrier added is produced by neutron irradiation of enriched ytterbium (^{176}Yb). Lutetium (^{177}Lu) decays by β -minus emission to stable Hafnium (^{177}Hf), with the most abundant β -minus (79.3%) having a maximum energy of 497 keV. Also, low gamma energy is emitted, for instance at 113 keV (6.2%) and 208 keV (11%).

For the full list of excipients, see section 6.1.

3. PHARMACEUTICAL FORM

Radiopharmaceutical precursor, solution.

Clear colourless solution.

4. CLINICAL PARTICULARS

4.1 Therapeutic indications

Lutetium (^{177}Lu) chloride Billev is a radiopharmaceutical precursor, and it is not intended for direct use in patients. It is to be used only for the radiolabelling of carrier molecules that have been specifically developed and authorised for radiolabelling with lutetium (^{177}Lu) chloride.

4.2 Posology and method of administration

Lutetium (^{177}Lu) chloride Billev is only to be used by specialists experienced with *in vitro* radiolabelling.

Posology

The quantity of Lutetium (^{177}Lu) chloride Billev required for radiolabelling and the quantity of lutetium (^{177}Lu)-labelled medicinal product that is subsequently administered will depend on the medicinal product radiolabelled and its intended use. Refer to the Summary of Product Characteristics/package leaflet of the particular medicinal product to be radiolabelled.

Paediatric population

For more information concerning paediatric use of lutetium (^{177}Lu)-labelled medicinal products refer to the Summary of Product Characteristics/Package Leaflet of the medicinal product to be radiolabelled.

Method of administration

Lutetium (^{177}Lu) chloride Billev is intended for *in vitro* radiolabelling of medicinal products which are subsequently administered by the approved route.

Lutetium (^{177}Lu) chloride Billev should not be administered directly to the patient.

For instructions on preparation of the medicinal product before administration, see section 12.

4.3 Contraindications

- Hypersensitivity to the active substance or to any of the excipients listed in section 6.1.
- Established or suspected pregnancy or when pregnancy has not been excluded (see section 4.6).

For information on contraindications to particular lutetium (^{177}Lu)-labelled medicinal products prepared by radiolabelling with Lutetium (^{177}Lu) chloride Billev, refer to the Summary of Product Characteristics/Package Leaflet of the particular medicinal product to be radiolabelled.

4.4 Special warnings and precautions for use

Individual benefit/risk justification

For each patient, the radiation exposure must be justifiable by the likely benefit. The activity administered should in every case be as low as reasonably achievable to obtain the required therapeutic effect.

Lutetium (^{177}Lu) chloride Billev is not to be administered directly to the patient but must be used for the radiolabelling of carrier molecules, such as monoclonal antibodies, peptides, vitamins or other substrates.

Renal impairment and haematological disorders

Careful consideration of the benefit risk ratio in these patients is required since an increased radiation exposure is possible. It is recommended to perform individual radiation dosimetry assessments of specific organs, which may not be the target organ of therapy.

Myelodysplastic syndrome and acute myeloid leukaemia

Myelodysplastic syndrome (MDS) and acute myeloid leukaemia (AML) have been observed after treatment with lutetium (^{177}Lu) peptide receptor radionuclide therapy for neuroendocrine tumours (see section 4.8). This should be taken into account when considering the benefit/risk, especially in patients with possible risk factors like prior exposure to chemotherapeutic agents (such as alkylating agents).

Myelosuppression

Anaemia, thrombocytopenia, leucopenia, lymphopenia, and less commonly neutropenia may occur during radioligand therapy with lutetium (^{177}Lu). Most events are mild and transient, but in some cases patients have required blood and platelet transfusions. In some patients more than one cell line may be affected and pancytopenia requiring treatment discontinuation has been described. A blood count should be taken at baseline and monitored regularly during treatment, in accordance with clinical guidance.

Renal irradiation

Radiolabelled somatostatin analogues are excreted by the kidney. Radiation nephropathy has been reported following peptide receptor radionuclide therapy for neuroendocrine tumours using other radioisotopes. Renal function should be assessed at baseline and during treatment and renal protection should be considered, in accordance with clinical guidance.

Hepatotoxicity

Cases of hepatotoxicity have been reported in the post-marketing setting and in the literature in patients with liver metastases undergoing treatment with lutetium (¹⁷⁷Lu) peptide receptor radionuclide therapy for neuroendocrine tumours. Liver function should be monitored regularly during treatment. Dose reduction may be necessary in affected patients.

Hormone release syndromes

There have been reports of carcinoid crisis and other syndromes associated with release of hormones from functional neuroendocrine tumours following lutetium (¹⁷⁷Lu) peptide receptor radionuclide therapy, which may be related to irradiation of tumour cells. Reported symptoms include flushing and diarrhoea associated with hypotension. Observation of patients by overnight hospitalisation should be considered in some cases (e.g. patients with poor pharmacologic control of symptoms). In case of hormonal crises, treatments may include: intravenous high dose somatostatin analogues, intravenous fluids, corticosteroids, and correction of electrolyte disturbances in patients with diarrhoea and/or vomiting.

Tumour lysis syndrome

Tumour lysis syndrome has been reported following lutetium (¹⁷⁷Lu) radioligand therapy. Patients with a history of renal insufficiency and high tumour burden may be at greater risk and should be treated with increased caution. Renal function as well as electrolyte balance should be assessed at baseline and during treatment.

Extravasation

There have been reports of extravasation of lutetium (¹⁷⁷Lu) labelled ligands in the post-marketing setting. In case of extravasation, infusion of the medicinal product should be immediately ceased, and the nuclear medicine physician and the radiopharmacist should be promptly informed. Management should be in accordance with local protocols.

Radiation protection

Point-source approximation shows that the average dose rate experienced 20 hours after administration of a dose of 7.3 GBq Lutetium (¹⁷⁷Lu) chloride Billev labelled radiopharmaceutical (residual radioactivity 1.5 GBq) by a person at 1 meter distance from the patient's body centre with an abdominal radius of 15 cm is 3.5 µSv/h. Doubling the distance to the patient to 2 meters reduces the dose rate by a factor of 4, to 0.9 µSv/h. The same dose in a patient with an abdominal radius of 25 cm yields a dose rate at 1 meter of 2.6 µSv/h. The generally accepted threshold for discharge of the treated patient from the hospital is 20 µSv/h. In most countries, the exposure limit for hospital staff is set the same as for the general public at 1 mSv/year. When taking the 3.5 µSv/h dose rate as an average, this would allow hospital staff to work approx. 300 hours/year in close vicinity of patients treated with Lutetium (¹⁷⁷Lu) chloride Billev labeled radiopharmaceuticals without wearing radiation protection. Of course, the nuclear medicine staff is expected to wear standard radiation protection. Any other person in close vicinity of the treated patient should be informed about possibilities to reduce his/her exposure due to radiation emitted from the patient.

Specific warnings

For information concerning special warnings and special precautions for use of lutetium (^{177}Lu)-labelled medicinal products refer also to the Summary of Product Characteristics/package leaflet of the medicinal product to be radiolabelled.

Further precautions with respect to relatives, carers and hospital staff are provided in section 6.6.

4.5 Interaction with other medicinal products and other forms of interaction

No interaction studies of lutetium (^{177}Lu) chloride with other medicinal products have been performed.

For information concerning interactions associated with the use of lutetium (^{177}Lu)-labelled medicinal products refer to the Summary of Product Characteristics/Package Leaflet of the medicinal product to be radiolabelled.

4.6 Fertility, pregnancy and lactation

Women of childbearing potential

When an administration of radiopharmaceuticals to a woman of childbearing potential is intended, it is important to determine whether or not she is pregnant. Any woman who has missed a period should be assumed to be pregnant until proven otherwise. If in doubt about her potential pregnancy (if the woman has missed a period, if the period is very irregular, etc.), alternative techniques not using ionising radiation (if there are any) should be offered to the patient. Before the use of ^{177}Lu -labelled medicinal products, pregnancy should be excluded using an adequate/validated test.

Pregnancy

The use of lutetium (^{177}Lu)-labelled medicinal products is contraindicated during established or suspected pregnancy or when pregnancy has not been excluded due to the risk of ionizing radiation to the foetus (see section 4.3).

Breast-feeding

Before administering radiopharmaceuticals to a mother who is breastfeeding, consideration should be given to the possibility of delaying the administration of radionuclide until the mother has ceased breastfeeding, and to what is the most appropriate choice of radiopharmaceuticals, bearing in mind the secretion of activity in breast milk. If the administration is considered necessary, breastfeeding should be interrupted, and the expressed feeds discarded.

Fertility

Effects of lutetium (^{177}Lu) chloride on male and female fertility have not been studied in animals. Low exposures could be demonstrated for male and female sexual organs. It cannot be excluded that ^{177}Lu -labelled medicinal products lead to reproductive toxicity including spermatogenetic damage in male testes or genetic damage in male testes or female ovaries.

Further information concerning the use of lutetium (^{177}Lu)-labelled medicinal products concerning fertility is specified in the Summary of Product Characteristics of the medicinal product to be radiolabelled.

4.7 Effects on ability to drive and use machines

Effects on ability to drive and to use machines following treatment by lutetium (^{177}Lu)-labelled medicinal products will be specified in the Summary of Product Characteristics/Package Leaflet of the medicinal product to be radiolabelled.

4.8 Undesirable effects

Summary of the safety profile

Adverse reactions following the administration of a lutetium (¹⁷⁷Lu)-labelled medicinal product prepared by radiolabelling with Lutetium (¹⁷⁷Lu) chloride Billev will be dependent on the specific medicinal product being used. Such information will be supplied in the Summary of Product Characteristics/Package Leaflet of the medicinal product to be radiolabelled.

Exposure to ionising radiation is linked with cancer induction and a potential for development of hereditary defects. The radiation dose resulting from therapeutic exposure may result in higher incidence of cancer and mutations. In all cases, it is necessary to ensure that the risks of the radiation are less than from the disease itself.

Tabulated list of adverse reactions

Adverse reactions are divided into groups according to the MedDRA convention frequencies: Very common ($\geq 1/10$), common ($\geq 1/100$ to $< 1/10$), uncommon ($\geq 1/1,000$ to $< 1/100$), rare ($\geq 1/10,000$ to $< 1/1,000$), very rare ($< 1/10,000$), not known (cannot be estimated from the available data).

Table 1. List of adverse reactions

MedDRA system organ class	Very common	Common	Uncommon	Not known
Neoplasms benign, malignant and unspecified (including cysts and polyps)		Refractory cytopenia with multilineage dysplasia (Myelodysplastic syndrome) (see section 4.4)	Acute myeloid leukaemia (see section 4.4)	
Blood and lymphatic system disorders	Anaemia Thrombocytopenia Leukopenia Lymphopenia	Neutropenia		Pancytopenia
Endocrine disorders				Carcinoid crisis
Metabolism and nutrition disorders				Tumour lysis syndrome
Gastrointestinal disorders	Nausea Vomiting			Dry mouth
Skin and subcutaneous tissue disorders	Alopecia			

Description of selected adverse reactions

Dry mouth

Dry mouth has been reported among patients with metastatic castration resistant prostate cancer receiving PSMA-targeted lutetium (^{177}Lu)-labelled radioligands and has been transient.

Alopecia

Alopecia, described as mild and temporary, has been observed among patients receiving lutetium (^{177}Lu) peptide receptor radionuclide therapy for neuroendocrine tumours.

Reporting of suspected adverse reactions

Reporting suspected adverse reactions after authorisation of the medicinal product is important. It allows continued monitoring of the benefit/risk balance of the medicinal product. Healthcare professionals are asked to report any suspected adverse reactions via [the national reporting system listed in Appendix V](#).

4.9 Overdose

The presence of free lutetium (^{177}Lu) chloride in the body after an inadvertent administration of Lutetium (^{177}Lu) chloride Billev will lead to increased bone marrow toxicity and haematopoietic stem cell damage. Therefore, in case of an inadvertent administration of Lutetium (^{177}Lu) chloride Billev, the radiotoxicity for the patient must be reduced by immediate (i.e. within 1 hour) administration of preparations containing chelators like Ca-DTPA or Ca-EDTA in order to increase the elimination of the radionuclide from the body.

The following preparations must be available in medical institutions, which use Lutetium (^{177}Lu) chloride Billev for labelling of carrier molecules for therapeutic purposes:

- Ca-DTPA (trisodium calcium diethylenetriaminepentaacetate) or
- Ca-EDTA (calcium disodium ethylenediaminetetraacetate)

These chelating agents help with the elimination of lutetium (^{177}Lu) radiotoxicity by an exchange between the calcium ion in the complex and the lutetium (^{177}Lu) ion. Due to the capacity of the chelating ligands (DTPA, EDTA) of forming water soluble complexes, the complexes and bound lutetium (^{177}Lu) are rapidly eliminated by the kidneys.

One gram of the chelating agents should be administered by slow intravenous injection over 3 – 4 minutes or by infusion (1 g in 100 – 250 mL of glucose, or sodium chloride 9 mg/mL (0.9%) solution for injection).

The chelating efficacy is greatest immediately or within one hour of exposure when the radionuclide is circulating in or available to tissue fluids and plasma. However, a post-exposure interval > 1 hour does not preclude the administration and effective action of chelator with reduced efficiency. Intravenous administration should not be protracted over more than 2 hours.

In any case, the blood parameters of the patient have to be monitored and the appropriate actions immediately taken if there is evidence of radiotoxicity.

The toxicity of free lutetium (^{177}Lu) due to *in-vivo* release from the labelled biomolecule in the body during therapy could be reduced by post-administration of chelating agents.

5. PHARMACOLOGICAL PROPERTIES

5.1 Pharmacodynamic properties

Pharmacotherapeutic group: Other therapeutic radiopharmaceuticals, ATC code: V10X

The pharmacodynamic properties of lutetium (^{177}Lu)-labelled medicinal products prepared by radiolabelling with Lutetium (^{177}Lu) chloride Billev, prior to administration, will be dependent on the nature of the medicinal product to be radiolabelled. Refer to the Summary of Product Characteristics/Package Leaflet of the particular medicinal product to be radiolabelled.

Lutetium (^{177}Lu) emits β -minus particles of moderate maximum energy (0.498 MeV) with a maximum tissue penetration of approximately 2 mm. Lutetium (^{177}Lu) also emits low-energy γ -rays which allow scintigraphic, biodistribution and dosimetry studies with the same lutetium (^{177}Lu)-labelled medicinal products.

Paediatric population

The European Medicines Agency has waived the obligation to submit the results of the studies with Lutetium (^{177}Lu) chloride Billev in all subsets of the paediatric population on grounds that the specific medicinal product does not represent a significant therapeutic benefit over existing treatments for paediatric patients. This waiver does however not extend to any therapeutic uses of the medicinal product when linked to a carrier molecule (see section 4.2 for information on paediatric use).

5.2 Pharmacokinetic properties

The pharmacokinetic properties of lutetium (^{177}Lu)-labelled medicinal products prepared by radiolabelling with Lutetium (^{177}Lu) chloride Billev, prior to administration, will be dependent on the nature of the medicinal product to be radiolabelled.

Distribution after inadvertent intravenous administration of lutetium (^{177}Lu) chloride

Data from experiments on mice, rats and rabbits indicate that more than half the lutetium (^{177}Lu) entering the systemic circulation is deposited in the skeleton with only small amounts going to the liver and kidneys. Lutetium (^{177}Lu) has a biological half-life of between 10 and 40 days in the soft tissue in mice and rats but has a very long biological half-life in the skeleton. However, these long half-life values in skeleton are not of relevance for lutetium (^{177}Lu) chloride n.c.a., since it completely decays with a half-life of 6.7 days following administration, preventing any accumulation over time. After intravenous injection of lutetium (^{177}Lu) chloride, lutetium (^{177}Lu) is predominantly but slowly excreted in the urine. Some faecal elimination is also observed.

5.3 Preclinical safety data

The toxicological properties of lutetium (^{177}Lu)-labelled medicinal products prepared by radiolabelling with Lutetium (^{177}Lu) chloride Billev prior to administration, will be dependent on the nature of the medicinal product to be radiolabelled.

The toxicity of non-radioactive lutetium chloride has been studied in different mammalian species and using different administration routes. The intraperitoneal LD50 in mice was found to be approximately 315 mg/kg. In cats, no pharmacological effects on respiration and cardiovascular function were observed up to a cumulative intravenous dose of 10 mg/kg. A high dose of 10 GBq of lutetium (^{177}Lu) chloride contains 2.4 μg lutetium, corresponding to a human dose of 0.034 $\mu\text{g}/\text{kg}$. This dose is approximately 7 orders of magnitude lower than the intraperitoneal LD50 in mice and more than 5 orders of magnitude lower than the NOEL observed in cats. Therefore, lutetium metal-ion toxicity of Lutetium (^{177}Lu) chloride Billev (^{177}Lu)-labelled medicinal products can be excluded.

6. PHARMACEUTICAL PARTICULARS

6.1 List of excipients

Hydrochloric acid, diluted

6.2 Incompatibilities

Radiolabelling of medicinal products, such as monoclonal antibodies, peptides, vitamins or other substrates, with lutetium (^{177}Lu) chloride is very sensitive to the presence of trace metal impurities.

It is important that all glassware, syringe needles etc., used for the preparation of the radiolabelled medicinal product are thoroughly cleaned to ensure freedom from such trace metal impurities. Only syringe needles (for example, non-metallic) with proven resistance to dilute acid should be used to minimise trace metal impurity levels.

In the absence of compatibility studies, this medicinal product must not be mixed with medicinal products other than the medicinal products to be radiolabelled.

6.3 Shelf life

Up to 11 days from the date of manufacture.

From a microbiological point of view, unless the method of withdrawal from the vial or any insertion into the vial preclude the risk of microbial contamination, the product should be used immediately. If not used immediately, in-use storage times and conditions prior to use are the responsibility of the user.

6.4 Special precautions for storage

Store in the original package in order to avoid unnecessary radiation exposure.

Storage of radiopharmaceuticals should be in accordance with national regulation on radioactive materials.

This medicinal product does not require any special temperature storage conditions.

6.5 Nature and contents of container

Clear type I glass 5 mL or 10 mL vial either conical or flat bottom, respectively, with a Teflon coated chlorobutyl rubber stopper, closed with an aluminum cap.

The vials are placed into a lead container for protective shielding and packed into a polystyrene box and an outer carton.

Pack sizes:

5 mL vial: 1, 2 or 3 vials

10 mL vial: 1, 2 or 3 vials

Not all pack sizes may be marketed.

6.6 Special precautions for disposal and other handling

Lutetium (^{177}Lu) chloride Billev is not intended for direct use in patients.

General warning

Radiopharmaceuticals should be received, used and administered only by authorised persons in designated clinical settings. Their receipt, storage, use, transfer and disposal are subject to the regulations and/or appropriate licenses of the competent official organisation.

Radiopharmaceuticals should be prepared in a manner which satisfies both radiation safety and pharmaceutical quality requirements. Appropriate aseptic precautions should be taken.

For instructions on extemporary preparation of the medicinal product before administration, see section 12.

If at any time in the preparation of this medicinal product the integrity of this container is compromised it should not be used.

Administration procedures should be carried out in a way to minimise risk of contamination of the medicinal product and irradiation of the operators. Adequate shielding is mandatory.

The surface dose rates and the accumulated dose depend on many factors. Measurements on the location and during work are critical and should be practiced for more precise and instructive determination of overall radiation dose to the staff. Healthcare personnel are advised to limit the time of close contact with patients injected with lutetium (^{177}Lu)-labelled radiopharmaceuticals. The use of television monitor systems to monitor the patients is recommended. Given the long half-life of lutetium (^{177}Lu), it is specially recommended to avoid internal contamination. For this reason it is mandatory to use protective high quality (latex/nitrile) gloves in any direct contact with the radiopharmaceutical (vial/syringe) and with the patient. For minimising radiation exposure resulting from repeated exposition there is no recommendation except the strict observance of the above ones.

The administration of radiopharmaceuticals creates risks for other persons from external radiation or contamination from spill of urine, vomiting, etc. Radiation protection precautions in accordance with national regulations must therefore be taken.

Any unused medicinal product or waste material must be disposed of in accordance with local requirements.

11. DOSIMETRY

The radiation dose received by various organs following intravenous administration of a lutetium (^{177}Lu)-labelled medicinal product will be dependent on the specific molecule being radiolabelled.

Information on radiation dosimetry of each different medicinal product following administration of the radiolabelled preparation is available in the Summary of Product Characteristics/Package Leaflet of the particular medicinal product to be radiolabelled.

The dosimetry tables below are presented in order to evaluate the contribution of non-conjugated lutetium (^{177}Lu) to the radiation dose following the administration of lutetium (^{177}Lu)-labelled medicinal product or resulting from an accidental intravenous injection of Lutetium (^{177}Lu) chloride Billev.

Dose calculations (absorbed normalised doses for target organs [mGy/MBq] and effective normalised doses [mSv/MBq]) were performed in Olinda/EXM 2 dose calculator using the mean \hat{A} value (mean between the \hat{A} values obtained from each considered animal study) for each source organ after administration of 1000 MBq. Organ doses are listed below for an adult male and female model as well as for 15-year, 10-year, 5-year, 1-year and newborn male and female models, according to ICRP 89 (International Commission on Radiological Protection).

The results show osteogenic cells, liver, kidneys, red marrow and spleen as the significant target organs for the biodistribution of lutetium (^{177}Lu) chloride.

Table 2. Estimated organ normalised absorbed doses [mGy/MBq] and normalised effective dose [mSv/MBq] in male models as calculated with the Olinda/EXM 2 dose calculator of $^{177}\text{LuCl}_3$

Target organ	Adults	15 year old	10 year old	5 year old	1 year old	Newborn

12. INSTRUCTIONS FOR PREPARATION OF RADIOPHARMACEUTICALS

Before use, packaging and radioactivity should be checked. Activity may be measured using an ionisation chamber.

Lutetium (^{177}Lu) is a beta(-)/gamma emitter. Activity measurements using an ionization chamber are very sensitive to geometric factors and therefore should be performed only under geometric conditions which have been appropriately validated.

Usual precautions regarding sterility and radioactivity should be respected.

Withdrawals should be performed under aseptic conditions. The vials must not be opened before disinfecting the stopper, the solution should be withdrawn via the stopper using a single dose syringe fitted with suitable protective shielding and a disposable sterile needle or using an authorised automated application system.

If the integrity of this vial is compromised, the medicinal product should not be used.

The complexing agent and other reagents should be added to the vial with lutetium (^{177}Lu) chloride. Free lutetium (^{177}Lu) is taken up and accumulates in the bones. This could potentially result in osteosarcomas. It is recommended to add a binding agent such as DTPA prior to intravenous administration of lutetium (^{177}Lu)-labelled conjugates in order to form a complex with free lutetium (^{177}Lu), if present, leading to a rapid renal clearance of lutetium (^{177}Lu).

Adequate quality control of the radiochemical purity of ready to use radiopharmaceuticals gained after radiolabelling with Lutetium (^{177}Lu) chloride Billev should be assured. Limits for radiochemical impurities should be set recognising the radiotoxicological potential of lutetium (^{177}Lu). Free non-bound lutetium (^{177}Lu) should be consequently minimised.

Detailed information on this medicinal product is available on the website of the European Medicines Agency <http://www.ema.europa.eu>.

ANNEX II

- A. MANUFACTURER RESPONSIBLE FOR BATCH RELEASE**
- B. CONDITIONS OR RESTRICTIONS REGARDING SUPPLY AND USE**
- C. OTHER CONDITIONS AND REQUIREMENTS OF THE MARKETING AUTHORISATION**
- D. CONDITIONS OR RESTRICTIONS WITH REGARD TO THE SAFE AND EFFECTIVE USE OF THE MEDICINAL PRODUCT**

A. MANUFACTURER(S) RESPONSIBLE FOR BATCH RELEASE

Name and address of the manufacturer(s) responsible for batch release

Cilatus Manufacturing Services Limited
Pembroke House
28-32 Pembroke Street Upper
Dublin 2
D02 EK84
Ireland

B. CONDITIONS OR RESTRICTIONS REGARDING SUPPLY AND USE

Medicinal product subject to restricted medical prescription (see Annex I: Summary of Product Characteristics, section 4.2).

C. OTHER CONDITIONS AND REQUIREMENTS OF THE MARKETING AUTHORISATION

- **Periodic safety update reports (PSURs)**

The requirements for submission of PSURs for this medicinal product are set out in the list of Union reference dates (EURD list) provided for under Article 107c(7) of Directive 2001/83/EC and any subsequent updates published on the European medicines web-portal.

D. CONDITIONS OR RESTRICTIONS WITH REGARD TO THE SAFE AND EFFECTIVE USE OF THE MEDICINAL PRODUCT

- **Risk management plan (RMP)**

The marketing authorisation holder (MAH) shall perform the required pharmacovigilance activities and interventions detailed in the agreed RMP presented in Module 1.8.2 of the marketing authorisation and any agreed subsequent updates of the RMP.

An updated RMP should be submitted:

- At the request of the European Medicines Agency;
- Whenever the risk management system is modified, especially as the result of new information being received that may lead to a significant change to the benefit/risk profile or as the result of an important (pharmacovigilance or risk minimisation) milestone being reached.

ANNEX III
LABELLING AND PACKAGE LEAFLET

B. PACKAGE LEAFLET

Package leaflet: Information for the patient

Lutetium (¹⁷⁷Lu) chloride Billev 51.8 GBq/mL radiopharmaceutical precursor, solution lutetium (¹⁷⁷Lu) chloride

Read all of this leaflet carefully before you are given this medicine combined with Lutetium (¹⁷⁷Lu) chloride Billev because it contains important information for you.

- Keep this leaflet. You may need to read it again.
- If you have any further questions, ask your nuclear medicine doctor who will supervise the procedure.
- If you get any side effects, talk to your nuclear medicine doctor. This includes any possible side effects not listed in this leaflet. See section 4.

What is in this leaflet

1. What Lutetium (¹⁷⁷Lu) chloride Billev is and what it is used for
2. What you need to know before Lutetium (¹⁷⁷Lu) chloride Billev is used
3. How the medicine radiolabelled with Lutetium (¹⁷⁷Lu) chloride Billev is used
4. Possible side effects
5. How Lutetium (¹⁷⁷Lu) chloride Billev is stored
6. Contents of the pack and other information

1. What Lutetium (¹⁷⁷Lu) chloride Billev is and what it is used for

Lutetium (¹⁷⁷Lu) chloride Billev is a type of product called a radiopharmaceutical precursor. It contains the active substance lutetium (¹⁷⁷Lu) chloride which gives off beta-minus radiation.

Lutetium (¹⁷⁷Lu) chloride Billev is not intended to be used on its own. Before use it has to be combined with other medicines (so called carrier medicines) that have been specially developed for use with lutetium (¹⁷⁷Lu) chloride. This process is called radiolabelling.

These carrier medicines may be substances that have been designed to recognise a particular type of cell in the body. The carrier medicine is given to the patient according to the instructions in that medicine's product information. It then carries the radiation to where it is needed in the body, to treat disease or to obtain images on a screen that are used to diagnose illness.

The use of a medicine radiolabelled with Lutetium (¹⁷⁷Lu) chloride Billev does involve exposure to radioactivity. Your doctor and the nuclear medicine doctor have considered that the clinical benefit of using Lutetium (¹⁷⁷Lu) chloride Billev outweighs the risk due to radiation.

For more information, refer to the Package Leaflet of the medicine that is to be radiolabelled with Lutetium (¹⁷⁷Lu) chloride Billev.

2. What you need to know before Lutetium (¹⁷⁷Lu) chloride Billev is used

Lutetium (¹⁷⁷Lu) chloride Billev must not be used

- if you are allergic to lutetium (¹⁷⁷Lu) chloride or any of the other ingredients of this medicine (listed in section 6);
- if you are pregnant or believe you may be pregnant.

For more information, refer to the Package Leaflet of the medicine that is to be radiolabelled with Lutetium (¹⁷⁷Lu) chloride Billev.

Warnings and precautions

Lutetium (¹⁷⁷Lu) chloride Billev is not to be administered directly to patients.

Take special care with the medicine that is radiolabelled with Lutetium (^{177}Lu) chloride Billev:
- if you have renal impairment or bone marrow disease.

Treatment with lutetium (^{177}Lu) may lead to the following side effects:

- a reduced number of red blood cells (anaemia);
- a reduced number of blood platelets (thrombocytopenia), which are important to stop bleeding;
- a reduced number of white blood cells (leukopenia, lymphopenia or neutropenia) which are important for protecting the body against infection.

Most of these events are mild and temporary. A reduced number of all 3 types of blood cells (red blood cells, platelets, and white blood cells - pancytopenia) has been described in some patients. Treatment has to be stopped in patients with pancytopenia.

Because lutetium (^{177}Lu) can sometimes affect your blood cells, your doctor will do blood tests before you start and at regular intervals during treatment. Talk to your doctor if you experience shortness of breath, bruising, nose bleeds, bleeding from your gums, or if you develop a fever.

When this medicine is used to radiolabel carrier medicines called somatostatin analogues used to treat cancers called neuroendocrine tumours, the radiolabelled carrier medicine is excreted by the kidneys. Your doctor will therefore take a blood test to measure your kidney function before you start and during treatment.

Treatment with lutetium (^{177}Lu) may affect the way your liver works. Your doctor will take a blood test to check your liver function during treatment.

Lutetium (^{177}Lu)-labelled medicines may be given directly into a vein through a tube known as a cannula. There have been reports of leakage of the fluid into the surrounding tissue (extravasation). Tell your doctor if you get any swelling or pain in your arm.

After neuroendocrine tumours are treated with lutetium (^{177}Lu), you may get symptoms associated with release of hormones from the tumour cells, known as a carcinoid crisis. Tell your doctor if you feel faint or dizzy or have flushing or diarrhoea following your treatment.

Treatment with lutetium (^{177}Lu) may cause tumour lysis syndrome, a condition resulting from the rapid breakdown of tumour cells. This may lead to abnormal blood test results, irregular heartbeat, kidney failure or seizures within a week of treatment. Your doctor will carry out blood tests to monitor you for this syndrome. Tell your doctor if you have muscle cramping, muscle weakness, confusion, or shortness of breath.

Please refer to the Package Leaflet of the medicine that is to be radiolabelled with Lutetium (^{177}Lu) chloride Billev for additional warnings and precautions.

Children and adolescents

Talk to your nuclear medicine doctor if you are under 18 years old.

Use of Lutetium (^{177}Lu) chloride Billev in children and adolescents under 18 years old depends on the medicine that is to be radiolabelled with Lutetium (^{177}Lu) chloride Billev. Please refer to the Package Leaflet of that medicine.

Other medicines and medicines radiolabelled with Lutetium (^{177}Lu) chloride Billev

Tell your nuclear medicine doctor if you are taking, have recently taken or might take any other medicines since they may interfere with the procedure.

It is not known whether lutetium (^{177}Lu) chloride may interact with other medicines as specific studies have not been carried out.

Pregnancy and breast-feeding

You must inform the nuclear medicine doctor before the administration of medicines radiolabelled with Lutetium (^{177}Lu) chloride Billev if there is a possibility you might be pregnant, if you have missed your period or if you are breast-feeding.

When in doubt, it is important to consult your nuclear medicine doctor who will supervise the procedure.

If you are pregnant

Medicines radiolabelled with Lutetium (^{177}Lu) chloride Billev must not be administered if you are pregnant.

If you are breast-feeding

You will be asked to stop breast-feeding. Please ask your nuclear medicine doctor when you can resume breast-feeding.

Driving and using machines

There could be effects on your ability to drive and to use machines due to the medicine used in combination with Lutetium (^{177}Lu) chloride Billev. Please read the package leaflet of that medicine carefully.

3. How the medicine radiolabelled with Lutetium (^{177}Lu) chloride Billev is used

There are strict laws on the use, handling and disposal of radiopharmaceuticals. Medicines radiolabelled with Lutetium (^{177}Lu) chloride Billev will only be used in special controlled areas. This medicine will only be handled and given to you by people who are trained and qualified to use it safely. These persons will take special care for the safe use of this medicine and will keep you informed of their actions.

The nuclear medicine doctor supervising the procedure will decide on the quantity of a medicine radiolabelled with Lutetium (^{177}Lu) chloride Billev to be used in your case. It will be the smallest quantity necessary to achieve the appropriate outcome, depending on the medicine you take with Lutetium (^{177}Lu) chloride Billev and what it is used for.

Administration of the medicine radiolabelled with Lutetium (^{177}Lu) chloride Billev and conduct of the procedure

Lutetium (^{177}Lu) chloride Billev must be used only in combination with another medicine (carrier medicine), which has been specifically developed and authorised for being combined with lutetium (^{177}Lu) chloride. The administration will depend on the type of the carrier medicine. Please read the Package Leaflet of that medicine.

Duration of the procedure

Your nuclear medicine doctor will inform you about the usual duration of the procedure.

After administration of the medicine radiolabelled with Lutetium (^{177}Lu) chloride Billev

The nuclear medicine doctor will inform you if you need to take any special precautions after receiving the medicine radiolabelled with Lutetium (^{177}Lu) chloride Billev. Contact your nuclear medicine doctor if you have any questions.

If you have been given more medicine radiolabelled with Lutetium (^{177}Lu) chloride Billev than you should

Since the medicine radiolabelled with Lutetium (^{177}Lu) chloride Billev is handled by a nuclear medicine doctor under strictly controlled conditions, there is only a very small chance of possible overdose. However, in the case of an overdose, you will receive appropriate treatment as necessary.

Should you have any further questions on the use of the medicine radiolabelled with Lutetium (^{177}Lu) chloride Billev, ask your nuclear medicine doctor who supervises the procedure.

4. Possible side effects

Like all medicines, the medicine radiolabelled with Lutetium (^{177}Lu) chloride Billev can cause side effects, although not everybody gets them.

Dry mouth has been reported among patients with prostate cancer receiving treatment with lutetium (^{177}Lu) and has been temporary.

Very common side effects (may affect more than 1 in 10 people):

- Reduction in blood cell counts (platelets, red or white blood cells)
- Nausea
- Vomiting

Side effects reported among patients treated for neuroendocrine tumours:

Very common (may affect more than 1 in 10 people):

- Mild temporary hair loss

Common (may affect up to 1 in 10 people):

- Bone marrow cancer (myelodysplastic syndrome)
- A reduced number of white blood cells (neutropenia)

Uncommon (may affect up to 1 in 100 people):

- Bone marrow cancer (acute myeloid leukaemia)

Not known (frequency cannot be estimated from the available data):

- Carcinoid crisis (release of hormones from the tumour cells)
- Tumour lysis syndrome (rapid breakdown of tumour cells)
- A reduced number of red blood cells, platelets, and white blood cells (pancytopenia)
- Dry mouth

Bone marrow cancer (myelodysplastic syndrome and acute myeloid leukaemia) has been reported in patients several years after treatment with carrier medicines radiolabelled with lutetium (^{177}Lu) for neuroendocrine tumours.

After the medicine radiolabelled with Lutetium (^{177}Lu) chloride Billev is given, it will deliver certain amounts of ionising radiation (radioactivity), which means there is a risk of cancer and development of hereditary defects. In all cases, the risk of the radiation is outweighed by the potential benefit of receiving the radiolabelled medicine.

For more information, refer to the Package Leaflet of the medicine to be radiolabelled with Lutetium (^{177}Lu) chloride Billev.

Reporting of side effects

If you get any side effects, talk to your nuclear medicine doctor. This includes any possible side effects not listed in this leaflet. You can also report side effects directly via the national reporting system listed in [Appendix V](#). By reporting side effects you can help provide more information on the safety of this medicine.

5. How Lutetium (^{177}Lu) chloride Billev is stored

You will not have to store this medicine. This medicine is stored under the responsibility of the specialist in appropriate premises. Storage of radiopharmaceuticals will be in accordance with national regulation on radioactive materials.

The following information is intended for the specialist only:

Keep this medicine out of the sight and reach of children.

Lutetium (^{177}Lu) chloride Billev must not be used after the expiry date and time which is stated on the label after EXP. Lutetium (^{177}Lu) chloride Billev will be stored in the original package that provides protection from radiation.

This medicine does not require any special temperature storage conditions.

6. Contents of the pack and other information

What Lutetium (^{177}Lu) chloride Billev contains

- The active substance is lutetium (^{177}Lu) chloride.
1 mL sterile solution contains 51.8 GBq lutetium (^{177}Lu) chloride on the activity reference time (ART), corresponding to maximum 12.6 micrograms of lutetium (^{177}Lu) (as chloride). (GBq: GigaBecquerel is the unit in which radioactivity is measured).
- The other ingredient is hydrochloric acid, diluted.

What Lutetium (^{177}Lu) chloride Billev looks like and contents of the pack

Lutetium (^{177}Lu) chloride Billev is a radiopharmaceutical precursor, solution. It is presented as a clear and colourless solution in a clear type I glass 5 mL or 10 mL vial either conical or flat bottom, respectively, with a Teflon coated chlorobutyl rubber stopper, closed with an aluminum cap. The vials are placed into a lead container for protective shielding and packed into a polystyrene box and an outer carton.

Pack sizes:

5 mL vial: 1, 2 or 3 vials

10 mL vial: 1, 2 or 3 vials

Not all pack sizes may be marketed.

The volume of one vial ranges from 0.1-8 mL solution (corresponding to 5.2-414.4 GBq at activity reference time). The volume depends on the quantity of medicine combined with Lutetium (^{177}Lu) chloride Billev required for administration by the nuclear medicine doctor.
