

## 1. NAME OF THE MEDICINAL PRODUCT

Ribavirin Teva 200 mg hard capsules

## 2. **QUALITATIVE AND QUANTITATIVE COMPOSITION**

Each Ribavirin Teva capsule contains 200 mg of ribavirin

For the full list of excipients, see section 6.1.

## 3. PHARMACEUTICAL FORM

Hard capsule. White, opaque and imprinted with blue ink.

## 4. CLINICAL PARTICULARS

## 4.1 **Therapeutic indications**

set authorised Ribavirin Teva is indicated in combination with other medicinal prohepatitis C (CHC) in adults (see sections 4.2, 4.4, and 5.1).

Ribavirin Teva is indicated in combination with other medicinal products for the treatment of chronic hepatitis C (CHC) for paediatric patients (children 3 years of age and older and adolescents) not e sections 4.2, 4.4 and 5.1). previously treated and without liver decompensation

## Posology and method of administration 4.2

Treatment should be initiated, and monitored a physician experienced in the management of chronic hepatitis C.

## **Posology**

Ribavirin Teva must be use ombination therapy as described in section 4.1.

Please refer to the corresponding Summary of Product Characteristics (SmPC) of medicinal products bavirin Teva for additional prescribing information particular to that used in combination with dosage recommendations on co-administration with Ribavirin Teva. product and for fy

sules are to be administered orally each day in two divided doses (morning and Ribaviri

nmended dose and duration of Ribavirin Teva depends on patient's weight and on the icinal product that is used in combination. Please refer to the corresponding SmPC of medicinal roducts used in combination with Ribavirin Teva.

In the cases in which no specific dose recommendation is made, the following dose should be used: Patient weight: < 75 kg = 1,000 mg and > 75 kg = 1,200 mg.

# *Paediatric population:*

No data are available in children below 3 years of age.

Note: For patients who weigh < 47 kg, or are unable to swallow capsules, ribavirin oral solution is available and should be used if appropriate.

Dosing of ribavirin for children and adolescent patients is determined by the patient body weight. For example, the body weight dosing used in conjunction with interferon alfa-2b or peginterferon alfa-2b is shown in **Table 1**. Please refer to the corresponding SmPC of medicinal products used in combination with ribavirin as some combination regimens do not adhere to the ribavirin dosing guidance provided in **Table 1**.

Table 1Ribavirin dose base	Ribavirin dose based on body weight when used in combination with interferon alfa-		
2b or peginterferon	alfa-2b in paediatric patients		
Patient weight (kg)	Daily ribavirin dose	Number of 200 mg capsules	
47 - 49	600 mg	3 capsules <sup>a</sup>	0,
50 - 65	800 mg	$4 \text{ capsules}^{b} \bullet \mathbf{C}$	
> 65	Refer to adult dose recommendations		

a: 1 morning, 2 evening

b: 2 morning, 2 evening

Dose modification for adverse reactions

## Dose modification for adults

Dose reduction of ribavirin depends on the initial ribavirin posology which depends on the medicinal product that is used in combination with ribavirin.

If a patient has a serious adverse reaction potentially related to ribaririn, the ribavirin dose should be modified or discontinued, if appropriate, until the adverse reaction abates or decreases in severity.

**Table 2** provides guidelines for dose modifications and discontinuation based on the patient's haemoglobin concentration, cardiac status and indirect bilinibin concentration.

Table 2         Management of Adverse Reactions				
Laboratory values	Reduce ritavirin dose*	Discontinue		
	if:	ribavirin if:		
Haemoglobin in patients with	< 10  g/dL	< 8.5 g/dL		
No Cardiac Disease	$\mathbf{\mathcal{N}}$			
Haemoglobin: Patients with	$\geq 2 \text{ g/dL}$ decrease in	< 12 g/dL despite 4 weeks at		
History of Stable Cardiac	haemoglobin during any	reduced dose		
Disease	4 week period during treatment			
<b>```</b>	(permanent dose reduction)			
Bilirubin – Indire	> 5  mg/dL	> 4 mg/dL (adults)		

\* For patients receiving a 1,000 mg (< 75 kg) or 1,200 mg (> 75 kg) dose, ribavirin dose should be reduced to 600 mg called (administered as one 200 mg capsule in the morning and two 200 mg capsules in the evening). If the abnormality is reversed, ribavirin may be restarted at 600 mg daily, and further increased to 800 mg daily at the discretion of the treating physician. However, a return to higher doses is no revoluted.

For patients receiving a 800 mg (< 65 kg) - 1,000 mg (65-80 kg) - 1,200 mg (81-105 kg) or 1,400 mg ( $^{105}$  kg) dose, 1<sup>st</sup> dose reduction of ribavirin is by 200 mg/day (except in patients receiving the 1,400 mg, dose reduction should be by 400 mg/day). If needed, 2<sup>nd</sup> dose reduction of ribavirin is by an additional 200 mg/day. Patients whose dose of ribavirin is reduced to 600 mg daily receive one 200 mg capsule in the morning and two 200 mg capsules in the evening.

In case of serious adverse reaction potentially related to medicinal products used in combination with ribavirin, refer to the corresponding SmPC of these medicinal products as some combination regimens do not adhere to the ribavirin dose modification and/or discontinuation guidelines as described in **Table 2**.

Dose modification for paediatric patients

Dose reduction in paediatric patients without cardiac disease follows the same guidelines as adult patients without cardiac disease regarding haemoglobin levels (**Table 2**).

There are no data for paediatric patients with cardiac disease (see section 4.4).

Table 3 provides guidelines for discontinuation based on the patient's indirect bilirubin concentration.

Table 3         Management of	Adverse Reactions
Laboratory values	Discontinue ribavirin if:
Bilirubin – Indirect	> 5  mg/dL (for > 4  weeks)
	(children and adolescents treated with interferon alfa-2b),
	or • 6
	> 4  mg/dL (for > 4  weeks)
	(children and adolescents treated with peginterferon alfa 20)

## Special populations

# Elderly ( $\geq 65$ years of age)

There does not appear to be a significant age-related effect on the pharmacoking of ribavirin. However, as in younger patients, renal function must be determined prior to administration of ribavirin (see section 5.2).

# Paediatric patients (children 3 years of age and older and adolescents

Ribavirin may be used in combination with peginterferon alfact becinterferon alfa-2b (see section 4.4). The selection of ribavirin formulation is based on individual characteristics of the patient. The safety and efficacy of ribavirin used together with disconceting-anti-virals in these patients has not been established. No data are available.

Please refer to the corresponding SmPC of medicinal products used in combination with ribavirin for further dosage recommendations on co-administration.

# Renal impairment

h patients with renal dysfunction due to reduction of The pharmacokinetics of ribavirin is altered apparent creatinine clearance in the enterthese section 5.2). Therefore, it is recommended that renal function be evaluated in all rationts prior to initiation of ribavirin. Adult patients with moderate renal impairment (creatinine c ear nce of 30-50 mL/minute) should be administered alternating daily doses of 200 mg and 400 mg A alt patients with severe renal impairment (creatinine clearance of with End Stage Renal Disease (ESRD) or on haemodialysis should be < 30 mL/minute) and patients ng/day. Table 4 provides guidelines for dose modification for patients administered ribavisin 200 Patients with impaired renal function should be more carefully monitored with with renal dysfung respect to the ment of anaemia. No data are available regarding dose modification for paediatric ith renal impairment.

Table Dosage Modification for Renal Impairment in Adult Patients			
<b>Creatinine Clearance</b>			
39 Mol mL/min	Alternating doses, 200 mg and 400 mg every other day		
ess than 30 mL/min	200 mg daily		
Haemodialysis (ESRD)	200 mg daily		

# Hepatic impairment

No pharmacokinetic interaction appears between ribavirin and hepatic function (see section 5.2). For use in patients with decompensated cirrhosis, see the corresponding SmPC of the medicinal products used in combination with ribavirin.

## Method of administration

Ribavirin Teva capsules should be administered orally with food.

## 4.3 **Contraindications**

- Hypersensitivity to the active substance or to any of the excipients listed in section 6.1.
- Pregnancy (see sections 4.4, 4.6 and 5.3). In females of childbearing potential, ribavirin must not be initiated until a report of a negative pregnancy test has been obtained immediately prior to initiation of therapy.
- Breast-feeding
- History of severe pre-existing cardiac disease, including unstable or uncontrolled cardiac disease, in the previous six months (see section 4.4).
- Haemoglobinopathies (e.g., thalassemia, sickle-cell anaemia).

Please refer to the corresponding SmPC of medicinal products used in combination with Ribavirin Teva for contraindications specific to these products. **4.4 Special warnings and precautions for use**

Ribavirin must be used in combination with other medicinal products (see section 5 Please refer to the SmPC of (peg)interferon alfa for details on the recommendati onitoring and management regarding the adverse reactions listed below before initiating the ind other precautions associated with (peg)interferon alfa.

There are several serious adverse reactions associated with the combination therapy of ribavirin with (peg)interferon alfa. These include:

- Severe psychiatric and central nervous system effects (suc bression, suicidal ideation, attempted suicide and aggressive behaviour, etc.)
- Growth inhibition in children and adolescents that my b e irreversible in some patients
- Increased thyroid stimulating hormone (TSH) in children and adolescents
- Severe ocular disorders
- Dental and periodontal disorders.

## Paediatric population

When deciding not to defer combination realment with peginterferon alfa-2b or interferon alfa-2b until adulthood, it is important to a that this combination therapy induced a growth inhibition onside The decision to treat should be made on a case by case. that may be irreversible in some patient

## Haemolysis

els to < 10 g/dL was observed in up to 14 % of adult patients and 7 % A decrease in haemoglobin of children and adolescen reated with ribavirin in combination with peginterferon alfa-2b or interferon alfa-2b in dinical trials. Although ribavirin has no direct cardiovascular effects, anaemia associated with risk in may result in deterioration of cardiac function, or exacerbation of the nary disease, or both. Thus, ribavirin must be administered with caution to patients symptoms of concardiac disease (see section 4.3). Cardiac status must be assessed before start of ionitored clinically during therapy; if any deterioration occurs, therapy must be stopped on 4.2).

# arciovascular

dult patients with a history of congestive heart failure, myocardial infarction and/or previous or current arrhythmic disorders must be closely monitored. It is recommended that those patients who have pre-existing cardiac abnormalities have electrocardiograms taken prior to and during the course of treatment. Cardiac arrhythmias (primarily supraventricular) usually respond to conventional therapy but may require discontinuation of therapy. There are no data in children or adolescents with a history of cardiac disease.

# Teratogenic risk

Prior to initiation of treatment with ribavirin the physician must comprehensively inform both male and female patients of the teratogenic risk of ribavirin, the necessity of effective and continuous

contraception, the possibility that contraceptive methods may fail and the possible consequences of pregnancy should it occur during or following treatment with ribavirin (see section 4.6). For laboratory monitoring of pregnancy, please refer to Laboratory tests.

## Acute hypersensitivity

If an acute hypersensitivity reaction (e.g., urticaria, angioedema, bronchoconstriction, anaphylaxis) develops, ribavirin must be discontinued immediately and appropriate medical therapy instituted. Transient rashes do not necessitate interruption of treatment.

## Liver function

Any patient developing significant liver function abnormalities during treatment must be monitored closely. Please refer to the corresponding SmPC of medicinal products used in combination with ribavirin for discontinuation or dose modification recommendations.

## Renal impairment

The pharmacokinetics of ribavirin is altered in patients with renal dysfunction due to reluction of apparent clearance in these patients. Therefore, it is recommended that renal function re-evaluated in all patients prior to initiation of ribavirin. Due to substantial increases in ribavirin olarma concentrations in patients with moderate and severe renal impairment, ribavirin are adjustments are recommended in adult patients with creatinine clearance < 50 mL/minute. No data are available regarding dose modification for paediatric patients with renal impairment tree sections 4.2 and 5.2). Haemoglobin concentrations should be monitored closely during treatment and corrective action taken as necessary (see section 4.2).

## Potential to exacerbate immunosuppression

Pancytopenia and bone marrow suppression have been reported in the literature to occur within 3 to 7 weeks after the administration of a peginterferon and ribavian concomitantly with azathioprine. This myelotoxicity was reversible within 4 to 6 weeks upon withdrawal of HCV antiviral therapy and concomitant azathioprine and did not recur upon restriction of either treatment alone (see section 4.5).

## HCV/HIV Co-infection

Mitochondrial toxicity and lactic acidosis Caution should be taken in HIV-positive subjects coinfected with HCV who receive inclosuide reverse transcriptase inhibitor (NRTI) treatment (especially ddI and d4T) and associated interferon alfa/ribavirin treatment. In the HIV-positive population receiving an NRTI recemen, physicians should carefully monitor markers of mitochondrial toxicity and lactic acidosis when ribavirin is administered. For additional details see section 4.5.

# Hepatic decompensation in HCV/HIV co-infected patients with advanced cirrhosis:

Co-infected patients with advanced cirrhosis receiving combined anti-retroviral therapy (cART) may be at increased risk of hepatic decompensation and death. Other baseline factors in co-infected patients that may be associated with a higher risk of hepatic decompensation include treatment with didanosine and elevated bilirubin serum concentrations.

Co-inisced patients receiving both antiretroviral (ARV) and anti-hepatitis treatment should be closely pontoed, assessing their Child-Pugh score during treatment. Please refer to the corresponding SmPC condicinal products used in combination with ribavirin for discontinuation or dose modification ecommendations. Patients progressing to hepatic decompensation should have their anti-hepatitis treatment immediately discontinued and the ARV treatment reassessed.

## Haematological abnormalities in HCV/HIV co-infected patients:

HCV/HIV co-infected patients receiving peginterferon alfa-2b/ribavirin treatment and cART may be at increased risk to develop haematological abnormalities (as neutropenia, thrombocytopenia and anaemia) compared to HCV mono-infected patients. Although, the majority of them could be managed by dose reduction, close monitoring of haematological parameters should be undertaken in this population of patients (see section 4.2 and below "Laboratory tests" and section 4.8).

Patients treated with ribavirin and zidovudine are at increased risk of developing anaemia; therefore, the concomitant use of ribavirin with zidovudine is not recommended (see section 4.5).

Patients with low CD4 counts:

In patients co-infected with HCV/HIV, limited efficacy and safety data (N = 25) are available in subjects with CD4 counts less than 200 cells/ $\mu$ L. Caution is therefore warranted in the treatment of patients with low CD4 counts.

Please refer to the corresponding SmPC of the antiretroviral medicinal products that are to be taken concurrently with HCV therapy for awareness and management of toxicities specific for each produce and the potential for overlapping toxicities with ribavirin.

## Laboratory tests

Standard haematologic tests, blood chemistries (complete blood count [CBC] and differential, platelet count, electrolytes, serum creatinine, liver function tests, uric acid) and pregnancy tests must be conducted in all patients prior to initiating therapy. Acceptable baseline values that may be considered as a guideline prior to initiation of ribavirin therapy:

HaemoglobinAdult:  $\geq 12 \text{ g/dL (females)}; \geq 13 \text{ g/dL (males)}$ <br/>Children and adolescents:  $\geq 11 \text{ g/dL (females)}; \geq 12 \text{ g/dL (males)}$ 

Laboratory evaluations are to be conducted at weeks 2 and 4 of the appropriate as clinically appropriate. HCV-RNA should be measured periodically during treatment (see section 4.2).

Uric acid may increase with ribavirin due to haemolysis; therefore, the potential for development of gout must be carefully monitored in pre-disposed patients.

Excipient(s)

# Sodium

This medicinal product contains less than a pimol sodium (23 mg) per hard capsule, that is to say essentially 'sodium-free'.

# 4.5 Interaction with other medicinal products and other forms of interaction

Interaction studies have only been performed in adults.

Results of *in vitro* studies using both human and rat liver microsome preparations indicated no cytochrome P450 mryme mediated metabolism of ribavirin. Ribavirin does not inhibit cytochrome P450 enzyme. There is no evidence from toxicity studies that ribavirin induces liver enzymes. Therefore, there is a minimal potential for P450 enzyme-based interactions.

Riburnin by having an inhibitory effect on inosine monophosphate dehydrogenase, may interfere with adhioprine metabolism possibly leading to an accumulation of 6-methylthioinosine horophosphate (6-MTIMP), which has been associated with myelotoxicity in patients treated with azathioprine. The use of pegylated alpha interferons and ribavirin concomitantly with azathioprine should be avoided. In individual cases where the benefit of administering ribavirin concomitantly with azathioprine warrants the potential risk, it is recommended that close hematologic monitoring be done during concomitant azathioprine use to identify signs of myelotoxicity, at which time treatment with these medicines should be stopped (see section 4.4).

No interaction studies have been conducted with ribavirin and other medicinal products, except for peginterferon alfa-2b, interferon alfa-2b and antacids.

No pharmacokinetic interactions were noted between ribavirin and peginterferon alfa-2b or interferon alfa-2b in a multiple-dose pharmacokinetic study.

## Antacid

The bioavailability of ribavirin 600 mg was decreased by co-administration with an antacid containing magnesium aluminium and simethicone;  $AUC_{tf}$  decreased 14 %. It is possible that the decreased bioavailability in this study was due to delayed transit of ribavirin or modified pH. This interaction is not considered to be clinically relevant.

## Nucleoside analogues

Use of nucleoside analogs, alone or in combination with other nucleosides, has resulted in lactic acidosis. Pharmacologically, ribavirin increases phosphorylated metabolites of purine nucleosides in vitro. This activity could potentiate the risk of lactic acidosis induced by purine nucleoside analogs (e.g. didanosine or abacavir). Co-administration of ribavirin and didanosine is not recommended Reports of mitochondrial toxicity, in particular lactic acidosis and pancreatitis, of which some latal, have been reported (see section 4.4).

The exacerbation of anaemia due to ribavirin has been reported when zidovudine's pert of the regimen used to treat HIV although the exact mechanism remains to be elucidated. The rencomitant use of ribavirin with zidovudine is not recommended due to an increased risk of enaemia (see section 4.4). Consideration should be given to replacing zidovudine in a combination anti-retroviral treatment (ART) regimen if this is already established. This would be particular important in patients with a known history of zidovudine induced anaemia.

Any potential for interactions may persist for up to two morths (five half-lives for ribavirin) after cessation of ribavirin therapy due to the long half-life (see section 5.2).

There is no evidence that ribavirin interacts with not-nucleoside reverse transcriptase inhibitors or protease inhibitors.

Conflicting findings are reported in literature on co-administration between abacavir and ribavirin. Some data suggest that HIV/HCV co-infecter patients receiving abacavir-containing ART may be at risk of a lower response rate to pegylated interferon/ribavirin therapy. Caution should be exercised when both medicines are co-administered.

# 4.6 Fertility, pregnancy and lactation

Women of childbearing prtential/contraception in males and females

# Female patients

Ribavirin mut not be used by females who are pregnant (see sections 4.3, 4.4 and 5.3). Extreme care must be taken to avoid pregnancy in female patients (see section 5.3). Ribavirin therapy must not be initiated unt) a report of a negative pregnancy test has been obtained immediately prior to initiation of therapy. Nemales of childbearing potential must use an effective contraceptive during treatment and for the months after treatment has been concluded; routine monthly pregnancy tests must be the provide during this time (see section 4.4). If pregnancy does occur during treatment or within four months from stopping treatment, the patient must be advised of the significant teratogenic risk of ribavirin to the foetus (see section 4.4).

# Male patients and their female partners

Extreme care must be taken to avoid pregnancy in partners of male patients taking ribavirin (see sections 4.3, 4.4 and 5.3). Ribavirin accumulates intracellularly and is cleared from the body very slowly. It is unknown whether the ribavirin that is contained in sperm will exert its potential teratogenic or genotoxic effects on the human embryo/foetus. Although data on approximately 300 prospectively followed pregnancies with paternal exposure to ribavirin have not shown an increased risk of malformation compared to the general population, nor any specific pattern of malformation,

either male patients or their female partners of childbearing age must be advised to use an effective contraceptive during treatment with ribavirin and for seven months after treatment. Routine monthly pregnancy tests must be performed during this time. Men whose partners are pregnant must be instructed to use a condom to minimise delivery of ribavirin to the partner.

## Pregnancy

The use of ribavirin is contraindicated during pregnancy. Ribavirin has been shown in preclinical studies to be teratogenic and genotoxic (see section 4.4 and 5.3).

## **Breast-feeding**

reactions in breast-fed infants, breast-feeding must be discontinued prior to initiation of treatment

Preclinical data:

- Fertility: In animal studies, ribavirin produced reversible effects on spermatoge section 5.3).
- Teratogenicity: Significant teratogenic and/or embryocidal potential have been emonstrated for ribavirin in all animal species in which adequate studies have been con u occurring at doses as low as one twentieth of the recommended human dose (see section 5.3).
- Genotoxicity: Ribavirin induces genotoxicity (see section 5.3)

## 4.7 Effects on ability to drive and use machines

Ribavirin has no or negligible influence on the ability to dry use machines; however, other medicinal products used in combination may have an eff T us, patients who develop fatigue, somnolence, or confusion during treatment must be cautioned to avoid driving or operating machinery.

## 4.8 **Undesirable effects**

## Summary of the safety profile

The salient safety issue of ribavirin is have no tic anaemia occurring within the first weeks of therapy. The haemolytic anaemia associated with bavirin therapy may result in deterioration of cardiac function and/or worsening of pre-existing cardiac disease. An increase in uric acid and indirect bilirubin values associated with nolysis were also observed in some patients.

this section are primarily derived from clinical trials and/or as adverse The adverse reactions liste ous reports when ribavirin was used in combination with interferon drug reactions from spor alfa-2b or peginte n alfa-2b.

presponding SmPC of medicinal products that are used in combination with itional undesirable effects reported with these products.

# with peginterferon alfa-2b or interferon alfa-2b

afety of ribavirin is evaluated from data from four clinical trials in patients with no previous xposure to interferon (interferon-naïve patients): two trials studied ribavirin in combination with interferon alfa-2b, two trials studied ribavirin in combination with peginterferon alfa-2b.

Patients who are treated with interferon alfa-2b and ribavirin after previous relapse from interferon therapy or who are treated for a shorter period are likely to have an improved safety profile than that described below.

## Tabulated list of adverse reactions for adults

The adverse reactions listed in **Table 5** are based on experience from clinical trials in adult naïve patients treated for 1 year and post-marketing use. A certain number of adverse reactions, generally attributed to interferon therapy but that have been reported in the context of hepatitis C therapy (in combination with ribavirin) are also listed for reference in **Table 5**. Also, refer to peginterferon alfa-2b and interferon alfa-2b SmPCs for adverse reactions that may be attributable to interferon monotherapy. Within the organ system classes, adverse reactions are listed under headings of frequency using the following categories: very common ( $\geq 1/10$ ); common ( $\geq 1/100$  to < 1/10); uncommon ( $\geq 1/10,000$  to < 1/1,000); very rare (< 1/10,000); not known. Within each frequency grouping, undesirable effects are presented in order of decreasing seriousness.

System Organ Class	Adverse Reactions
Infections and infestations	
Very common:	Viral infection, pharyngitis
Common:	Bacterial infection (including sepsis), fungal infection, influenza, respiratory tract infection, bronchuis, nerpes simplex, sinusitis, otitis media, rhinitis, usinary tract infection
Uncommon	Lower respiratory tract infection
Rare:	Pneumonia*
	unspecified (including cysts and polyps)
Common:	Neoplasm unspecified
Blood and lymphatic system disord	
Very common:	Anaemia, neutropenaHaemolitic anaemia, leukopenia, thrombocytopenia,
Common:	lymphadenobathy, lymphopenia
Very rare:	Aplastic anamia*
Not known:	Pure red ell aplasia, idiopathic thrombocytopenic purpura
I WI KIOWII.	throuberc thrombocytopenic purpura
Immune system disorders	
Uncommon:	Drug hypersensitivity
Rare:	Sarcoidosis*, rheumatoid arthritis (new or aggravated)
Not known:	Vogt-Koyanagi-Harada syndrome, systemic lupus
	erythematosus, vasculitis, acute hypersensitivity reactions including urticaria, angioedema, bronchoconstriction, anaphylaxis
Endocrine disorders	
Common:	Hypothyroidism, hyperthyroidism
Metabolism and pubrition disorder	S
Very common:	Anorexia
Common	Hyperglycaemia, hyperuricaemia, hypocalcaemia,
	dehydration, increased appetite
Urcompor.	Diabetes mellitus, hypertriglyceridemia*
Psychiatric disorders	
very common:	Depression, anxiety, emotional lability, insomnia
Common:	Suicidal ideation, psychosis, aggressive behaviour,
	confusion, agitation, anger, mood altered, abnormal
	behaviour, nervousness, sleep disorder, decreased libido
	apathy, abnormal dreams, crying
Uncommon:	Suicide attempts, panic attack, hallucination
Rare:	Bipolar disorder*
Very rare:	Suicide*
Not known:	Homicidal ideation*, mania*, mental status change
Nervous system disorders	Tionneidar ideation , maina , mentar status enange

Common:	Amnesia, memory impairment, syncope, migraine, ataxia,
	paraesthaesia, dysphonia, taste loss, hypoaesthesia,
	hyperaesthesia, hypertonia, somnolence, disturbance in
	attention, tremor, dysgeusia
Uncommon:	Neuropathy, peripheral neuropathy
Rare:	Seizure (convulsion)*
Very rare:	Cerebrovascular haemorrhage*, cerebrovascular ischaemia
	encephalopathy*, polyneuropathy*
Not known:	Facial palsy, mononeuropathies
Eye disorders	
Common:	Visual disturbance, blurred vision, conjunctivitis, eye
	irritation, eye pain, abnormal vision, lacrimal gland
	dry eye
Rare:	Retinal haemorrhages*, retinopathies (including macular
	oedema)*, retinal artery occlusion*, retinct vein occlusion*
	optic neuritis*, papilloedema*, loss of visual acuity or visu
	field*, retinal exudates*
Ear and labyrinth disorders	
Common:	Vertigo, hearing impaired/loss, tinuitus, ear pain
Cardiac disorders	
Common:	Palpitation, tachycardia
Uncommon	Myocardial infarction
Rare:	Cardiomyopathy*, a bynmia*
Very rare:	Cardiac ischaenne*
Not known:	Pericardial eifusion*, pericarditis*
Vascular disorders	
Common:	Hypoension, hypertension, flushing
Rare	Vescultus
Very rare:	Peroheral ischaemia*
Respiratory, thoracic and me	
Very common:	Dyspnoea, coughing Epistaxis, respiratory disorder, respiratory tract congestion.
Common:	sinus congestion, nasal congestion, rhinorrhea, increased
	upper airway secretion, pharyngolaryngeal pain,
(	nonproductive cough
Very rare:	Pulmonary infiltrates*, pneumonitis*, interstitial
	pneumonitis*
Gastro-intestingh disorders	provincinus
Very common:	Diarrhoea, vomiting, nausea, abdominal pain

Sexual dysfunction (not pecified)*
site conditions
Fatigue, rizor pyrexia, influenza like illness, asthenia,
irritability
Chestopaia, chest discomfort, peripheral oedema, malaise, feeling abnormal, thirst
Face oedema
Weight decrease

\* Since ribavirin has always been prescribed with an alpha interferon product, and the listed adverse drug reactions included reflecting post-marketing experience do not allow precise quantification of frequency, the frequency reported above is from clinical trials using ribavirin in combination with interferon alfa-2b (pegylited or non-pegylated).

# Description of selected adverse reactions

A reduction in bach globin concentrations by > 4 g/dL was observed in 30 % of patients treated with ribavirin and peginterferon alfa-2b and 37 % of patients treated with ribavirin and interferon alfa-2b. Haemoglobin levels dropped below 10 g/dL in up to 14 % of adult patients and 7 % of children and adorscents reated with ribavirin in combination with either peginterferon alfa-2b or interferon alfa-2b.

Were some cases of more severe neutropenia in patients treated with ribavirin in combination with peginterferon alfa-2b (WHO grade 3: 39 of 186 [21 %]; and WHO grade 4: 13 of 186 [7 %]); WHO grade 3 leukopenia was also reported in 7 % of this treatment group.

An increase in uric acid and indirect bilirubin values associated with haemolysis was observed in some patients treated with ribavirin used in combination with peginterferon alfa-2b or interferon alfa-2b in clinical trials, but values returned to baseline levels by four weeks after the end of therapy. Among those patients with elevated uric acid levels, very few patients treated with the combination developed clinical gout, none of which required treatment modification or discontinuation from the clinical trials.

## HCV/HIV co-infected patients

For HCV/HIV co-infected patients receiving ribavirin in combination with peginterferon alfa-2b, other adverse reactions (that were not reported in mono-infected patients) which have been reported in the studies with a frequency > 5 % were: oral candidiasis (14 %), lipodystrophy acquired (13 %), CD4 lymphocytes decreased (8 %), appetite decreased (8 %), gamma-glutamyltransferase increased (9 %), back pain (5 %), blood amylase increased (6 %), blood lactic acid increased (5 %), cytolytic hepatitis (6 %), lipase increased (6 %) and pain in limb (6 %).

## Mitochondrial toxicity

Mitochondrial toxicity and lactic acidosis have been reported in HIV-positive patients receiving NRTI regimen and associated-ribavirin for co-HCV infection (see section 4.4).

## Laboratory values for HCV/HIV co-infected patients

Although haematological toxicities of neutropenia, thrombocytopenia and anaemia occurre frequently in HCV/HIV co-infected patients, the majority could be managed by dose modi cat rarely required premature discontinuation of treatment (see section 4.4). Haematologic abnormalities were more frequently reported in patients receiving ribavirin in combination with per feron alfa-2b when compared to patients receiving ribavirin in combination with interferon afab. In Study 1 (see section 5.1), decrease in absolute neutrophil count levels below 500 cells in was observed in 4 % (8/194) of patients and decrease in platelets below 50,000/mm was observed in 4 % (8/194) of patients receiving ribavirin in combination with peginterferon alfa-2b. mia (haemoglobin < 9.4 g/dL) was reported in 12 % (23/194) of patients treated with riba view in combination with peginterferon alfa-2b.

## CD4 lymphocytes decrease:

Treatment with ribavirin in combination with peginterfet welft-2b was associated with decreases in absolute CD4+ cell counts within the first 4 weeks without a reduction in CD4+ cell percentage. The decrease in CD4+ cell counts was reversible upon dese reduction or cessation of therapy. The use of ribavirin in combination with peginterferon alfae2b and no observable negative impact on the control of HIV viraemia during therapy or follow-up. Limited safety data (N = 25) are available in co-infected patients with CD4+ cell counts <  $200/\mu$ L (see vection 4.4).

Please refer to the corresponding SmPG of the antiretroviral medicinal products that are to be taken concurrently with HCV therapy for avarchess and management of toxicities specific for each product and the potential for overlapping for avarchess with ribavirin in combination with other medicinal products.

## Paediatric population:

## In combination with peginterferon alfa-2b

In a clinical trial with 07 children and adolescent patients (3 to 17 years of age) treated with combination therary of peginterferon alfa-2b and ribavirin, dose modifications were required in 25 % of patients, most commonly for anaemia, neutropenia and weight loss. In general, the adverse reactions profile in children and adolescents was similar to that observed in adults, although there is a paediatric specific concern regarding growth inhibition. During combination therapy for up to 48 weeks with pegylated interferon alfa-2b and ribavirin, growth inhibition was observed that resulted in educed height in some patients (see section 4.4). Weight loss and growth inhibition were very common during the treatment (at the end of treatment, mean decrease from baseline in weight and in height percentiles were of 15 percentiles and 8 percentiles, respectively) and growth velocity was inhibited (< 3<sup>rd</sup> percentile in 70 % of the patients).

At the end of 24 weeks post-treatment follow-up, mean decrease from baseline in weight and height percentiles were still 3 percentiles and 7 percentiles, respectively, and 20% of the children continued to have inhibited growth (growth velocity  $< 3^{rd}$  percentile). Ninety four of 107 children enrolled in the 5 year long-term follow up trial. The effects on growth were less in those children treated for 24 weeks than those treated for 48 weeks. From pre-treatment to end of long-term follow up among children treated for 24 or 48 weeks, height for age percentiles decreased 1.3 and 9.0 percentiles, respectively. Twenty four percent of children (11/46) treated for 24 weeks and 40 % of children (19/48) treated for

48 weeks had a > 15 percentile height for age decrease from pre-treatment to the end of 5 year long term follow up compared to pre-treatment baseline percentiles. Eleven percent of children (5/46) treated for 24 weeks and 13 % of children (6/48) treated for 48 weeks were observed to have a decrease from pre-treatment baseline > 30 height for age percentiles to the end of the 5 year long term follow-up. For weight, pre-treatment to end of long term follow up, weight for age percentiles decreased 1.3 and 5.5 percentiles among children treated for 24 weeks or 48 weeks, respectively. For BMI, pre-treatment to end of long-term follow up, BMI for age percentiles decreased 1.8 and 7.5 percentiles among children treated for 24 weeks, respectively. Decrease in mean height percentile at year 1 of long term follow-up was most prominent in prepubertal age children. The decline of height, weight and BMI Z scores observed during the treatment phase in comparison to a normative population did not fully recover at the end of long-term follow-up period for children treated with 48 weeks of therapy (see section 4.4).

In the treatment phase of this study, the most prevalent adverse reactions in all subjects were special (80 %), headache (62 %), neutropenia (33 %), fatigue (30 %), anorexia (29 %) and injection-sile erythema (29 %). Only 1 subject discontinued therapy as the result of an adverse reaction (thrombocytopenia). The majority of adverse reactions reported in the study were not normoderate in severity. Severe adverse reactions were reported in 7 % (8/107) of all subjects and induced injection site pain (1 %), pain in extremity (1 %), headache (1 %), neutropenia (1 %), add prexia (4 %). Important treatment-emergent adverse reactions that occurred in this patient population were nervousness (8 %), aggression (3 %), anger (2 %), depression/depressed mod (4 %) and hypothyroidism (3 %) and 5 subjects received levothyroxine treatment or hypothyroidism/elevated TSH.

## In combination with interferon alfa-2b

In clinical trials of 118 children and adolescents 3 to 16 age treated with combination therapy of interferon alfa-2b and ribavirin, 6 % discontinued therapy due to adverse events. In general, the adverse event profile in the limited children and addrescent population studied was similar to that observed in adults, although there is a paediatric specific concern regarding growth inhibition, as decrease in height percentile (mean percentile decrease of growth velocity of 9 percentile) and weight percentile (mean percentile decrease of 12 percentile) were observed during treatment. Within the 5 years follow-up post-treatment period th hildren had a mean height of 44<sup>th</sup> percentile, which was below the median of the normative coult ion and less than their mean baseline height  $(48^{th} \text{ percentile})$ . Twenty (21 %) of 9) children had a > 15 percentile decrease in height percentile, of whom 10 of the 20 children had a 30 percentile decrease in their height percentile from the start of treatment to the end of long term follow-up (up to 5 years). Final adult height was available for 14 of those children and demonstrated that 12 continued to show height deficits > 15 percentiles, 10 to 12 ent. During combination therapy for up to 48 weeks with interferon alfayears after the end of treat which inhibition was observed that resulted in reduced final adult height in some 2b and ribavirin, ar, decrease in mean height percentile from baseline to the end of the long-term patients. In pa most prominent in prepubertal age children (see section 4.4). follow-ur

Furthermore, suicidal ideation or attempts were reported more frequently compared to adult patients (2.4% vs 1%) during treatment and during the 6 month follow-up after treatment. As in adult means, children and adolescents also experienced other psychiatric adverse reactions (e.g., expression, emotional lability, and somnolence) (see section 4.4). In addition, injection site disorders, pyrexia, anorexia, vomiting, and emotional lability occurred more frequently in children and adolescents compared to adult patients. Dose modifications were required in 30% of patients, most commonly for anaemia and neutropenia.

## Tabulated list of adverse reactions in paediatric population

Reported adverse reactions listed in **Table 6** are based on experience from the two multicentre children and adolescents clinical trials using ribavirin with interferon alfa-2b or peginterferon alfa-2b. Within the organ system classes, adverse reactions are listed under headings of frequency using the following categories: very common ( $\geq 1/10$ ); common ( $\geq 1/100$  to <1/10), and uncommon ( $\geq 1/1,000$  to

< 1/100). Within each frequency grouping, undesirable effects are presented in order of decreasing seriousness.

peginterferon alfa-2b System Organ Class	Adverse Reactions
Infections and infestations	Auverse Reactions
Very common:	Viral infection, pharyngitis
Common:	Fungal infection, bacterial infection, pulmonary infection
Common.	nasopharyngitis, pharyngitis streptococcal, otitis media
	sinusitis, tooth abscess, influenza, oral herpes, herpesimples
	urinary tract infection, vaginitis, gastroenteritis
Uncommon	Pneumonia, ascariasis, enterobiasis, herpes zostry, cellulitis
	nspecified (including cysts and polyps)
Common:	Neoplasm unspecified
Blood and lymphatic system disorde	
Very common:	Anaemia, neutropenia
Common:	Thrombocytopenia, lymphadenovalny
Endocrine disorders	
Very common:	Hypothyroidism
Common:	Hyperthyroidism, virin m
Metabolism and nutrition disorders	
Very common:	Anorexia, increased appetite, decreased appetite
Common:	Anorexia, increased appetite, decreased appetite Hypertrighyceridemia, hyperuricemia

Common	Skin laceration	

of the changes in laboratory values in the ribavirin/peginterferon alfa-2b clinical trial were mild r moderate. Decreases in haemoglobin, white blood cells, platelets, neutrophils and increase in bilirubin may require dose reduction or permanent discontinuation from therapy (see section 4.2). While changes in laboratory values were observed in some patients treated with ribavirin used in combination with peginterferon alfa-2b in the clinical trial, values returned to baseline levels within a few weeks after the end of therapy.

## Reporting of suspected adverse reactions

Reporting suspected adverse reactions after authorisation of the medicinal product is important. It allows continued monitoring of the benefit/risk balance of the medicinal product. Healthcare

professionals are asked to report any suspected adverse reactions via the national reporting system listed in Appendix V.

## 4.9 **Overdose**

In clinical trials with ribavirin used in combination with peginterferon alfa-2b or interferon alfa-2b, the maximum overdose reported was a total dose of 10 g of ribavirin (50 x 200 mg capsules) and 39 MIU of interferon alfa-2b (13 subcutaneous injections of 3 MIU each) taken in one day by a patient in an attempt at suicide. The patient was observed for two days in the emergency room, during which time oriser no adverse reaction from the overdose was noted.

## PHARMACOLOGICAL PROPERTIES 5.

## 5.1 **Pharmacodynamic properties**

Pharmacotherapeutic group: Antivirals for systemic use, antivirals for treatment of ATC code: J05AP01.

## Mechanism of action

Ribavirin is a synthetic nucleoside analogue which has shown in vitro a kity against some RNA and DNA viruses. The mechanism by which ribavirin in combination without medicinal products exerts its effects against HCV is unknown. Oral formulations of ribavirin monotherapy have been investigated as therapy for chronic hepatitis C in several clinica esults of these investigations showed that ribavirin monotherapy had no effect on elimina hepatitis virus (HCV-RNA) or improving hepatic histology after 6 to 12 months of the and 6 months of follow-up.

## Clinical efficacy and safety

## Ribavirin in combination with Direct Antiviral (DAA):

DAA for a full description of the clinical data with such Please refer to the SmPC of the correspondent combination.

from the original development with (peg)interferon alfa-2b Only the description of the use of is detailed in the current SmPC:

# Bitherapy with peginterferon alfa-2b:

ation treatment with peginterferon alfa-2b or interferon alfa-2b was The use of ribavirin in co evaluated in a number of clinical trials. Eligible patients for these trials had chronic hepatitis C confirmed by a positive HCV-RNA polymerase chain reaction assay (PCR) (> 30 IU/mL), a liver a histological diagnosis of chronic hepatitis with no other cause for the chronic biopsy consistent w hepatitis, and nal serum ALT.

amined the use of interferon in naïve patients, two with ribavirin + interferon alfa-2b  $2^{\circ}$  and I95-143) and one with ribavirin + peginterferon alfa-2b (C/I98-580). In all cases the ment was for one year with a follow-up of six months. The sustained response at the end of now-up was significantly increased by the addition of ribavirin to interferon alfa-2b (41 % vs 16 %, p < 0.001).

In clinical trials C95-132 and I95-143, ribavirin + interferon alfa-2b combination therapy proved to be significantly more effective than interferon alfa-2b monotherapy (a doubling in sustained response). Combination therapy also decreased the relapse rate. This was true for all HCV genotypes, particularly Genotype 1, in which the relapse rate was reduced by 30 % compared with interferon alfa-2b monotherapy.

In clinical trial C/I98-580, 1,530 naïve patients were treated for one year with one of the following combination regimens:

- Ribavirin (800 mg/day) + peginterferon alfa-2b (1.5 micrograms/kg/week) (n = 511).
- Ribavirin (1,000/1,200 mg/day) + peginterferon alfa-2b (1.5 micrograms/kg/week for one month followed by 0.5 microgram/kg/week for 11 months) (n = 514).
- Ribavirin (1,000/1,200 mg/day) + interferon alfa-2b (3 MIU three times a week) (n = 505).

In this trial, the combination of ribavirin and peginterferon alfa-2b (1.5 micrograms/kg/week) was significantly more effective than the combination of ribavirin and interferon alfa-2b, particularly in patients infected with Genotype 1. Sustained response was assessed by the response rate six months after the cessation of treatment.

HCV genotype and baseline virus load are prognostic factors which are known to affect response rates. However, response rates in this trial were shown to be dependent also on the dose of ribavirin administered in combination with peginterferon alfa-2b or interferon alfa-2b. In those patients that received > 10.6 mg/kg ribavirin (800 mg dose in typical 75 kg patient), regardless of 2 notype or viral load, response rates were significantly higher than in those patients that received  $\leq$  10.6 mg/kg ribavirin (**Table 7**), while response rates in patients that received > 13.2 mg/kg ribavirin were even higher.

\* Any subject with an undetectable HCV-RNA level at the follow-up week 12 visit and missing data at the follow-up week 24 visit was considered a sustained responder. Any subject with missing data in and after the follow-up

week 12 window was considered to be a non-responder at week 24 of follow-up.

The 6 month treatment duration in this trial was better tolerated than one year of treatment in the pivotal combination trial; for discontinuation 5 % vs. 14 %, for dose modification 18 % vs. 49 %

In a non-comparative trial, 235 patients with genotype 1 and low viral load (< 600) received peginterferon alfa-2b, 1.5 microgram/kg subcutaneously, once week bination with weight adjusted ribavirin. The overall sustained response rate after a 24-we treatment duration was 50 %. Forty-one percent of subjects (97/235) had nondetectable plasma HCV-RNA levels at week 4 and week 24 of therapy. In this subgroup, there was a (89/97) sustained virological response rate. The high sustained response rate in this b of patients was identified in an interim analysis (n=49) and prospectively confi Limited historical data indicate that treatment for 48 weeks mi sociated with a higher sustained response rate (11/11) and with a lower risk of 0/11 as compared to 7/96 pse following 24 weeks of treatment).

A large randomized trial compared the safety and theory of treatment for 48 weeks with two peginterferon alfa-2b/ribavirin regimens [peginte feron alfa-2b 1.5  $\mu$ g/kg and 1  $\mu$ g/kg subcutaneously once weekly both in combination with ribavirin 800 to 1,400 mg p.o. daily (in two divided doses)] and peginterferon alfa-2a 180  $\mu$ g subcutaneously once weekly with ribavirin 1,000 to 1,200 mg p.o. daily (in two divided doses) in 3,070 treatment-naïve adults with chronic hepatitis C genotype 1. Response to the treatment was measured by Sustained Virologic Response (SVR) which is defined as undetectable hCV-RNA at 24 weeks post-treatment (see **Table 9**).

Table 9Virologic response at treatment week 12, end of treatment response, relapse rate\*and Sustained Virologic Response (SVR)

\*HCV-RNA PCR assay, with a lower limit of quantitation of 27 IU/mL

Lack of early virologic response by treatment week 12 (detectable HCV-RNA with a  $< 2 \log_{10}$  reduction from baseline) was a criterion for discontinuation of treatment.

In all three treatment groups, sustained virologic response rates were similar. In patients of African American origin (which is known to be a poor prognostic factor for HCV eradication), treatment with peginterferon alfa-2b (1.5 µg/kg)/ribavirin combination therapy resulted in a higher sustained virologic response rate compared to peginterferon alfa-2b 1 µg/kg dose. At the peginterferon alfa-2b 1.5 µg/kg plus ribavirin dose, sustained virologic response rates were lower in patients with cirrhosis, in patients with normal ALT levels, in patients with a baseline viral load > 600,000IU/mL and in patients

>40 years old. Caucasian patients had a higher sustained virologic response rate compared to the sec African Americans. Among patients with undetectable HCV-RNA at the end of treatment, the relapse rate was 24 %.

## Predictability of sustained virological response in naïve patients

Virological response by week 12 is defined as at least 2-log viral load decrease or undetecta levels of HCV-RNA. Virological response by week 4 is defined as at least 1-log viral load or undetectable levels of HCV-RNA. These time points (treatment week 4 and treatm have been shown to be predictive for sustained response (Table 10).

1.5 μg/kg/riba		Negative			Positive

\*Genotype 1 receive 48 weeks treatment

\*\*Genotype 2, 3 receive 24 weeks treatment

\*\*\*The presented results are from a single point of time. A patient may be missing or have had a different result for week 4 or week 12.

<sup>†</sup> These criteria were used in the protocol: If week 12 HCV-RNA is positive and  $< 2 \log_{10}$  decrease from baseline, patients to stop therapy. If week 12 HCV-RNA is positive and decreased  $\geq 2 \log_{10}$  from baseline, then retest HCV-RNA at week 24 and if positive, patients to stop therapy.

## HCV/HIV Co-infected patients

Two trials have been conducted in patients co-infected with HIV and HCV. The response to treatment in both of these trials is presented in **Table 11**. Study 1 (RIBAVIC; P01017) was a randomized, multicentre study which enrolled 412 previously untreated adult patients with chronic hepatitis C who were co-infected with HIV. Patients were randomized to receive either ribavirin (800 mg/day) plus peginterferon alfa-2b (1.5  $\mu$ g/kg/week) or ribavirin (800 mg/day) plus interferon alfa-2b (3 MIU TIW) for 48 weeks with a follow-up period of 6 months. Study 2 (P02080) was a randomized, single centre study that enrolled 95 previously untreated adult patients with chronic hepatitis C who were coinfected with HIV. Patients were randomized to receive either ribavirin (800-1,200 mg/day based weight) plus peginterferon alfa-2b (100 or 150  $\mu$ g/week based on weight) or ribavirin (800-1,200 mg/day based on weight) plus interferon alfa-2b (3 MIU TIW). The duration of therapy was 48 weeks with a follow-up period of 6 months except for patients infected with genotypes 2 m 2 and viral load < 800,000 IU/mL (Amplicor) who were treated for 24 weeks with a 6 month for previously up period.

# Histological response

Liver biopsies were obtained before and after treatment in Study 1 and were available for 210 of the 412 subjects (51 %). Both the Metavir score and Ishak grade decreased among subjects treated with ribavirin in combination with peginterferon alfa-2b. This decline was significant among responders (-0.3 for Metavir and -1.2 for Ishak) and stable (-0.1 for Metavir and -0.2 for Ishak) among non-responders. In terms of activity, about one-third of sustained responders showed improvement and none showed worsening. There was no improvement in terms of fibrosis observed in this study. Steatosis was significantly improved in patients infected with HCV Genotype 3.

# *Previously treated patients*

Retreatment of prior treatment failures (relapse and non-responder patients) with peginterferon alfa-2b in combination with ribavirin:

In a non-comparative trial, 2,293 patients with moderate to severe fibrosis who failed previous treatment with combination alpha interferon/ribavirin were retreated with peginterferon alfa-2b, 1.5 microgram/kg subcutaneously, once weekly, in combination with weight adjusted ribavirin. Failure to prior therapy was defined as relapse or non-response (HCV-RNA positive at the end of a minimum of 12 weeks of treatment).

NR: Non-responder defined as serum/plasma HCV-RNA positive at the end of a minimum of 12 weeks of treatment. Plasma HCV-RNA is measured with a research-based quantitative polymerase chain reaction assive by a central laboratory

\*Intent to treat population includes 7 patients for whom at least 12 weeks of prior therapy could not be confirmed.

Overall, approximately 36 % (821/2,286) of patients had undetectable plasma five-RNA levels at week 12 of therapy measured using a research-based test (limit of detection 12.2U/mL). In this subgroup, there was a 56 % (463/823) sustained virological response rate. For patients with prior failure on therapy with non-pegylated interferon or pegylated interferon and negative at week 12, the sustained response rates were 59 % and 50 %, respectively. Among 480 patients with > 2 log viral reduction but detectable virus at week 12, altogether 188 ratems continued therapy. In those patients the SVR was 12 %.

Non-responders to prior therapy with pegylated interferon apha/ribavirin were less likely to achieve a week 12 response to retreatment than non-responders to non-pegylated interferon alpha/ribavirin (12.4 % vs. 28.6 %). However, if a veek 12 response was achieved, there was little difference in SVR regardless of prior treatment or prior response.

Retreatment of relapse patients with riba irip and interferon alfa-2b combination treatment Two trials examined the use of ribevisin and interferon alfa-2b combination treatment in relapse patients (C95-144 and I95-145); 345 shronic hepatitis patients who had relapsed after previous interferon treatment were treated to six months with a six month follow-up. Combination therapy with ribavirin and interferon alfa-2b resulted in a sustained virological response that was ten-fold higher than that with interferon alfa-2b alone (49 % vs 5 %, p < 0.0001). This benefit was maintained irrespective of standard predictors of response to interferon alfa-2b such as virus level, HCV genotype and histological standard.

## Long-term effica y data - Adults

Two large long term follow-up studies enrolled 1,071 patients and 567 patients after treatment in prior studies with ion-pegylated interferon alfa-2b (with or without ribavirin) and pegylated interferon alfa-2b (with

The Kaplan-Meier estimate for continued sustained response over 5 years is 97 % (95 % CI: 95-99 %) for patients receiving non-pegylated interferon alfa-2b (with or without ribavirin), and is 99 % (95 % CI: 98-100 %) for patients receiving pegylated interferon alfa-2b (with or without ribavirin). SVR after treatment of chronic HCV with interferon alfa-2b (pegylated and non-pegylated, with or without ribavirin) results in long-term clearance of the virus providing resolution of the hepatic infection and clinical 'cure' from chronic HCV. However, this does not preclude the occurrence of hepatic events in patients with cirrhosis (including hepatocarcinoma).

# Paediatric population

# Clinical efficacy and safety

# Ribavirin in combination with peginterferon alfa-2b

Children and adolescents 3 to 17 years of age with compensated chronic hepatitis C and detectable HCV-RNA were enrolled in a multicentre trial and treated with ribavirin 15 mg/kg per day plus pegylated interferon alfa-2b 60  $\mu$ g/m<sup>2</sup> once weekly for 24 or 48 weeks, based on HCV genotype and baseline viral load. All patients were to be followed for 24 weeks post-treatment. A total of

107 patients received treatment of whom 52 % were female, 89 % Caucasian, 67 % with HCV Genotype 1 and 63 % < 12 years of age. The population enrolled mainly consisted of children  $\bullet$  with mild to moderate hepatitis C. Due to the lack of data in children with severe progression at the disease, and the potential for undesirable effects, the benefit/risk of the combination of ribavirin and pegylated interferon alfa-2b needs to be carefully considered in this population excitons 4.1, 4.4 and 4.8). The study results are summarized in **Table 13**.

	response rates (n <sup>a,b</sup> (%)) in previously reatment duration – All subjects	y untreated children and adolescents
	n = 107	
	24 weeks	48 weeks
All Genotypes	26/27 (96 %)	44/80 (55 %)
Genotype 1		38/72 (53 %)
Genotype 2	14/15 (93 %)	-
Genotype 3 <sup>c</sup>	12/12 (100 %	2/3 (67 %)
Genotype 4	- 10	4/5 (80 %)

a: Response to treatment was defined as undetectable HCV-INA at 24 weeks post-treatment, lower limit of detection = 125 IU/mL.

b: n = number of responders/number of subjects with given genotype, and assigned treatment duration.

c: Patients with genotype 3 low viral load (< 600, v0 IU/nL) were to receive 24 weeks of treatment while

those with genotype 3 and high viral load ( $\geq 0.00100$  IU/mL) were to receive 48 weeks of treatment.

# Ribavirin in combination with interferen tlfa-2b

Children and adolescents 3 to 16 year of age with compensated chronic hepatitis C and detectable HCV-RNA (assessed by a central aboratory using a research-based RT-PCR assay) were enrolled in two multicentre trials and received ribavirin 15 mg/kg per day plus interferon alfa-2b 3 MIU/m 3 times a week for 1 year ollowed by 6 months follow-up after treatment. A total of 118 patients were Caucasian, and 78 % genotype 1, 64  $\% \le 12$  years of age. The population enrolled: 57 % male 80 % enrolled mainly c ed in children with mild to moderate hepatitis C. In the two multicentre trials, Difference in children and adolescents were similar to those in adults. Due to sustained vire the lack of da in these two multicentre trials for children with severe progression of the disease, and undesirable effects, the benefit/risk of the combination of ribavirin and interferon the poter to be carefully considered in this population (see sections 4.1, 4.4 and 4.8).

andy results are summarized in Table 14.

## Long-term efficacy data

## Ribavirin in combination with peginterferon alfa-2b

A five-year long-term, observational, follow-up study enrolled 94 paediatric chronic hepatitis C patients after treatment in a multicentre trial. Of these, sixty-three were sustained responders. The purpose of the study was to annually evaluate the durability of sustained virologic response (SVP) an assess the impact of continued viral negativity on clinical outcomes for patients who were sustained responders 24 weeks post-treatment with 24 or 48 weeks of peginterferon alfa-2b and ribatrin treatment. At the end of 5 years, 85 % (80/94) of all enrolled subjects and 86 % (54/65) of sustained responders completed the study. No paediatric subjects with SVR relapsed during the 5 years of follow-up.

# Ribavirin in combination with interferon alfa-2b

A five-year long-term, observational, follow-up study enrolled 97 paediatic chronic hepatitis C patients after treatment in two previously mentioned multicentre trials (Sepenty percent (68/97) of all enrolled subjects completed this study of which 75 % (42/56) were subtained responders. The purpose of the study was to annually evaluate the durability of sustaine c response (SVR) and assess the impact of continued viral negativity on clinical outcome patients who were sustained responders 24 weeks post-treatment of the 48-week intervent and ribavirin treatment. All but one of the paediatric subjects remained sustained virologic esponders during long-term follow-up after completion of treatment with interferon alfa-21 plus ribavirin. The Kaplan-Meier estimate for continued sustained response over 5 years is 98 30 20 % CI: 95 %, 100 %] for paediatric patients Additionally, 98 % (51/52) with normal ALT levels at treated with interferon alfa-2b and ribavirin follow-up week 24 maintained normal AI Ivels at their last visit.

SVR after treatment of chronic HCV with non-pegylated interferon alfa-2b with ribavirin results in long-term clearance of the virus poviding resolution of the hepatic infection and clinical 'cure' from chronic HCV. However, this does not preclude the occurrence of hepatic events in patients with cirrhosis (including hepatocrean).

# 5.2 Pharmacokinetic properties

In a single dose, traspover study of ribavirin in healthy adult subjects, the capsule and oral solution formulations ver round to be bioequivalent.

Riberethis absorbed rapidly following oral administration of a single dose (mean Tmax= 1.5 hours), followed by rapid distribution and prolonged elimination phases (single dose half-lives of absorption, listibution and elimination are 0.05, 3.73 and 79 hours, respectively). Absorption is extensive with approximately 10 % of a radiolabelled dose excreted in the faeces. However, absolute bioavailability is approximately 45 %-65 %, which appears to be due to first pass metabolism. There is a linear relationship between dose and AUC<sub>tf</sub> following single doses of 200-1,200 mg ribavirin. Volume of distribution is approximately 5,000 l. Ribavirin does not bind to plasma proteins.

# Distribution

Ribavirin transport in non-plasma compartments has been most extensively studied in red cells, and has been identified to be primarily via an es-type equilibrative nucleoside transporter. This type of transporter is present on virtually all cell types and may account for the high volume of distribution of

ribavirin. The ratio of whole blood:plasma ribavirin concentrations is approximately 60:1; the excess of ribavirin in whole blood exists as ribavirin nucleotides sequestered in erythrocytes.

## **Biotransformation**

Ribavirin has two pathways of metabolism: 1) a reversible phosphorylation pathway; 2) a degradative pathway involving deribosylation and amide hydrolysis to yield a triazole carboxyacid metabolite. Both ribavirin and its triazole carboxamide and triazole carboxylic acid metabolites are also excreted renally.

Ribavirin has been shown to produce high inter- and intra-subject pharmacokinetic variability following single oral doses (intrasubject variability of approximately 30 % for both AUC and C<sub>max</sub>), which may be due to extensive first pass metabolism and transfer within and beyond the blood compartment.

## **Elimination**

Upon multiple dosing, ribavirin accumulates extensively in plasma with a six-fold rate of multipledose to single-dose  $AUC_{12hr}$ . Following oral dosing with 600 mg BID, steady-state was reached by approximately four weeks, with mean steady state plasma concentrations approximately 2,200 ng/mL. Upon discontinuation of dosing the half-life was approximately 298 hours, which probably reflects slow elimination from non-plasma compartments.

## Transfer into seminal fluid

Seminal transfer of ribavirin has been studied. Ribavirin concentration in seminal fluid is approximately two-fold higher compared to serum. However, ribavirin ystemic exposure of a female partner after sexual intercourse with a treated patient has been estimated and remains extremely limited compared to therapeutic plasma concentration of ribavilin.

## Food effect

The bioavailability of a single oral dose of ribavine was increased by co-administration of a high fat meal (AUC<sub>tf</sub> and  $C_{max}$  both increased by 70%). It is possible that the increased bioavailability in this study was due to delayed transit of ribavirie or modified pH. The clinical relevance of results from this single dose study is unknown. In the pixel clinical efficacy trial, patients were instructed to take ribavirin with food to achieve the maximal plasma concentration of ribavirin.

## Renal function

Based on published data, since dose ribavirin pharmacokinetics was altered (increased AUC<sub>tf</sub> and  $C_{max}$ ) in patients with renarrivefunction compared with control subjects (creatinine clearance > 90 mL/minute). The mean AUC<sub>tf</sub> was threefold greater in subjects with creatinine clearance between 10 and 30 mL/min compared with control subjects. In subjects with creatinine clearance between 30 and 50 mL/min, APO<sub>tf</sub> was twofold greater compared with control subjects. This appears to be due to reduction of opparent clearance in these patients. Ribavirin concentrations are essentially unchanged by haemodialysis.

## Heparic Function

ingle dose pharmacokinetics of ribavirin in patients with mild, moderate or severe hepatic stunction (Child-Pugh Classification A, B or C) is similar to those of normal controls.

## *Elderly patients* ( $\geq 65$ years of age)

Specific pharmacokinetic evaluations for elderly subjects have not been performed. However, in a population pharmacokinetic study, age was not a key factor in the kinetics of ribavirin; renal function is the determining factor.

*Population pharmacokinetic analysis* was performed using sparsely sampled serum concentration values from four controlled clinical trials. The clearance model developed showed that body weight, gender, age, and serum creatinine were the main covariates. For males, clearance was approximately 20 % higher than for females. Clearance increased as a function of body weight and was reduced at

ages greater than 40 years. Effects of these covariates on ribavirin clearance appear to be of limited clinical significance due to the substantial residual variability not accounted for by the model.

## Paediatric population

## Ribavirin in combination with peginterferon alfa-2b

Multiple-dose pharmacokinetic properties for ribavirin and peginterferon alfa-2b in children and adolescent patients with chronic hepatitis C have been evaluated during a clinical study. In children and adolescent patients receiving body surface area-adjusted dosing of peginterferon alfa-2b at 60  $\mu$ g/m2/week, the log transformed ratio estimate of exposure during the dosing interval is predicted to be 58 % (90 % CI: 141-177 %) higher than observed in adults receiving 1.5  $\mu$ g/kg/week. The pharmacokinetics of ribavirin (dose-normalized) in this trial was similar to those reported in a prior study of ribavirin in combination with interferon alfa-2b in children and adolescent patients and the adult patients.

## Ribavirin in combination with interferon alfa-2b

Multiple-dose pharmacokinetic properties for ribavirin and interferon alfa-2b in childran and adolescents with chronic hepatitis C between 5 and 16 years of age are summarized in **Table 15**. The pharmacokinetics of ribavirin and interferon alfa-2b (dose-normalized) is similar in adults and children or adolescents.

	multiple-dose pharmacokinetic parame administered to paediatric patients wt	
Parameter	Ribavirin	Interferon alfa-2b
	15 mg/kg/day as 2 divided	3 MIU/m2 3 times a week
	doses	(n = 54)
	(n = 17)	
Tmax (hr)	1.9 (3)	5.9 (36)

AUC*	29,774 (26)	622 (48)
Apparent clearance L/hr/k	kg 0.27 (27)	Not done

\*AUC<sub>12</sub> (ng.hr/mL) for ribavirin; AUC<sub>0.2</sub> (IU.hr/mL) for interferon alfa-2b

# 5.3 Preclinical safety data

## Ribavirin

Ribavirin is embryotoxic or eratogenic, or both, at doses well below the recommended human dose in all animal species in which tudies have been conducted. Malformations of the skull, palate, eye, jaw, limbs, skeleton and extract were noted. The incidence and severity of teratogenic effects increased with exclusion of the dose. Survival of foetuses and offspring was reduced.

In a juve ilevat toxicity study, pups dosed from postnatal day 7 to 63 with 10, 25 and 50 mg/kg of ribation demonstrated a dose-related decrease in overall growth, which was subsequently manifested as sigh decreases in body weight, crown-rump length and bone length. At the end of the recovery beried, tibial and femoral changes were minimal although generally statistically significant compared to controls in males at all dose levels and in females dosed with the two highest doses compared to controls. No histopathological effects on bone were observed. No ribavirin effects were observed regarding neurobehavioural or reproductive development. Plasma concentrations achieved in rat pups were below human plasma concentrations at the therapeutic dose.

Erythrocytes are a primary target of toxicity for ribavirin in animal studies. Anaemia occurs shortly after initiation of dosing, but is rapidly reversible upon cessation of treatment.

In 3- and 6-month studies in mice to investigate ribavirin-induced testicular and sperm effects, abnormalities in sperm, occurred at doses of 15 mg/kg and above. These doses in animals produce systemic exposures well below those achieved in humans at therapeutic doses. Upon cessation of

treatment, essentially total recovery from ribavirin-induced testicular toxicity occurred within one or two spermatogenic cycles (see section 4.6).

Genotoxicity studies have demonstrated that ribavirin does exert some genotoxic activity. Ribavirin was active in the Balb/3T3 in vitro transformation assay. Genotoxic activity was observed in the mouse lymphoma assay, and at doses of 20-200 mg/kg in a mouse micronucleus assay. A dominant lethal assay in rats was negative, indicating that if mutations occurred in rats they were not transmitted through male gametes.

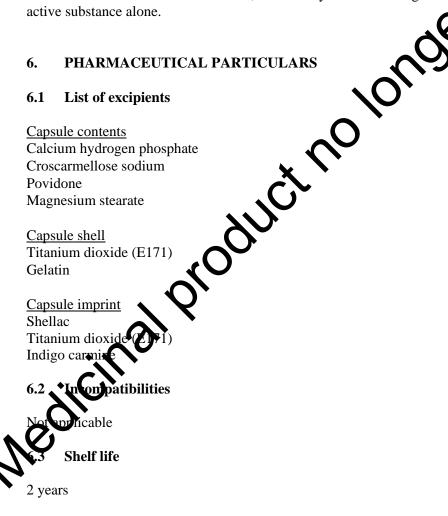

Conventional carcinogenicity rodent studies with low exposures compared to human exposure under therapeutic conditions (factor 0.1 in rats and 1 in mice) did not reveal tumorigenicity of ribavirin. In addition, in a 26 week carcinogenicity study using the heterozygous p53(+/-) mouse model, ribaving did not produce tumours at the maximally tolerated dose of 300 mg/kg (plasma exposure fact approximately 2.5 compared to human exposure). These studies suggest that a carcinogen of ribavirin in humans is unlikely.

## Ribavirin plus interferon

When used in combination with peginterferon alfa-2b or interferon alfa-2b, ribave not cause any effects not previously seen with either active substance alone. The major treatment-related change was a reversible mild to moderate anaemia, the severity of which was greater than that produced by either related change was active substance alone.

## PHARMACEUTICAL PARTICULARS 6.

## 6.1 List of excipients

## **Special precautions for storage** 6.4

Do not store above 30°C.

## 6.5 Nature and contents of container

Ribavirin Teva capsules are packaged in blisters consisting of polyvinyl chloride (PVC)/polyethylene (PE)/polyvinylidene chloride (PVdC)-aluminium blister packs

Packs of 84, 112, 140 and 168 capsules Not all pack sizes may be marketed.

## 6.6 Special precautions for disposal

onder authorised Any unused medicinal product or waste material should be disposed of in accordance with local requirements.

# Package leaflet: Information for the user

#### **Ribavirin Teva 200mg hard capsules** ribavirin

## Read all of this leaflet carefully before you start taking this medicine because it contains important information for you.

- Keep this leaflet. You may need to read it again.
- If you have any further questions, ask your doctor, pharmacist or nurse.
- This medicine has been prescribed for you only Do not pass it on to others. It may harm them, i, possible authorite even if their signs of illness are the same as yours.
- If you get any side effects, talk to your doctor, pharmacist or nurse. This includes any po side effects not listed in this leaflet. See section 4.

### What is in this leaflet:

- What Ribavirin Teva is and what it is used for 1.
- What you need to know before you use Ribavirin Teva 2.
- 3. How to use Ribavirin Teva
- 4. Possible side effects
- How to store Ribavirin Teva 5.
- Contents of the pack and other information 6.

#### What Ribavirin Teva is and what it is used for 1.

Ribavirin Teva contains the active substance ribavirin. This dicine stops the multiplication of hepatitis C virus. Ribavirin Teva must not be used a

Depending on the genotype of the hepatitis C virus that you have, your doctor may choose to treat you with a combination of this medicine with other medicines. There may be some further treatment limitations if you have or have not been previously treated for chronic hepatitis C infection. Your doctor will recommend the best cour rapy.

d other medicines is used to treat patients who have chronic The combination of Ribavirin Tev a ai hepatitis C (HCV).

Ribavirin Teva may be used in adiatric patients (children 3 years of age and older and adolescents) who are not previously teared and without severe liver disease.

children and adolescents) weighing less than 47 kg a solution formulation is For paediatric pa available

or the relation on the use of this medicine, ask your doctor or pharmacist.

### at you need to know before you use Ribavirin Teva

### not take Ribavirin Teva

Do not take Ribavirin Teva if any of the following apply to you or the child you are caring for.

Talk to your doctor or pharmacist before taking Ribavirin Teva if you:

- are **allergic** to ribavirin or any of the other ingredients of this medicine (listed in section 6).
- are pregnant or planning to become pregnant. (see section "Pregnancy and breast-feeding")
- are **breast-feeding**
- had a serious **heart** problem during the past 6 months

- have any **blood disorders**, such as anaemia (low blood count), thalassemia or sickle-cell anaemia.
- Reminder: Please read the "Do not take" section of the Package leaflet for the other medicines used in combination with this medicine.

# Warnings and precautions

There are several serious adverse reactions associated with the combination therapy of ribavirin with (peg)interferon alfa. These include:

- Psychiatric and central nervous system effects (such as depression, suicidal thoughts, attempted suicide and aggressive behaviour, etc.). Be sure to seek emergency care if you notice that you are becoming depressed or have suicidal thoughts or change in your behaviour. You may want to consider asking a family member or close friend to help you stay alert to signs of depression or changes in your behaviour
- Severe eye disorders
- Dental and periodontal disorders: Dental and gum disorders have been reported in patients receiving ribavirin in combination with (peg)interferon alfa-2b. You should brich your teeth thoroughly twice daily and have regular dental examinations. In addition some patients may experience vomiting. If you have this reaction, be sure to rinse your month thoroughly afterwards
- Inability to achieve full adult height may occur in some children and adolescents
- Increased hormone related to your thyroid (TSH) in children and addlescents

### Paediatric population

If you are caring for a child and your doctor decides not to deter combination treatment with peginterferon alfa-2b or interferon alfa-2b until adulthool, trisimportant to understand that this combination therapy induces a growth inhibition that may be irreversible in some patients.

In addition these events have occurred in patients taking Ribavirin Teva:

Haemolysis: Ribavirin Teva can cause a break down in red blood cells causing anaemia which may impair your heart function or worsen symptons of heart disease.

Pancytopenia: Ribavirin Teva can cause a degrease in your platelet and red and white blood cell count when used in combination with peginterform.

Standard blood tests will be taken to check your blood, kidney and liver function.

- Blood tests will be define equilarly to help your doctor to know if this treatment is working.
- Depending upon the results of these tests, your doctor may change/adjust the number of capsules you or the child you are caring for take, prescribe a different pack size of this medicine, and/or change the length of time to take this treatment.
- If you have r hevelop severe kidney or liver problems, this treatment will be stopped.

Seek medicathelp **immediately** if you develop symptoms of a severe allergic reaction (such as difficulty in ) reathing, wheezing or hives) while taking this treatment.

to your doctor if you or the child you are caring for

- are a woman of **childbearing** age (see section "Pregnancy and breast-feeding").
- are a **male** and your female partner is of childbearing age (see section "Pregnancy and breast-feeding").
- had a previous **heart** condition or have heart disease.
- have another **liver** problem in addition to hepatitis C infection.
- have problems with your **kidneys**.
- have **HIV** (human immunodeficiency virus) or have ever had any other problems with your immune system.

Please refer to the Package Leaflet of (peg)interferon alfa for more detailed information on these safety issues.

Reminder: Please read the "Warnings and precautions" section of the Package leaflet for the other medicines used in combination with Ribavirin Teva before you begin combination treatment.

## Use in children and adolescents

If the child is weighing less than 47 kg or unable to swallow capsules an oral solution of ribavirin is available.

# Other medicines and Ribavirin Teva

Tell your doctor or pharmacist if you or the child you are caring for, are taking, have recently taken or might take:

- azathioprine is a medicine that suppresses your immune system, using this medicine in combination with ribavirin may increase your risk of developing severe blood disorders.
- anti-Human Immunodeficiency Virus (HIV) medicines [nucleoside reverse transcripta inhibitor (**NRTI**), and/or combined anti-retroviral therapy (**cART**)]:
  - Taking this medicine in combination with an alpha interferon and an ant-HV medicine may increase the risk of lactic acidosis, liver failure, and blood abnormalities development (reduction in number of red blood cells which carry over a certain white blood cells that fight infection, and blood clotting cells called plateles).
  - With **zidovudine** or **stavudine**, it is not certain if this medicine will change the way these medicines work. Therefore, your blood will be checked regramy to be sure that the HIV infection is not getting worse. If it gets worse, your docur will decide whether or not your Ribavirin Teva treatment needs to be changed Additionally, patients receiving **zidovudine** with **ribavirin** in combination **with aphaimerferons** could be at increased risk of developing anaemia (low number of ref blood cells). Therefore the use of zidovudine and ribavirin in combination with apha interferons is not recommended.
  - Due to the risk of lactic acidosis (a built to of lactic acid in the body) and pancreatitis, the use of **ribavirin and didanosine** is not recommended and the use of **ribavirin and stavudine** should be avoided.
  - Co-infected patients with advanced liver disease receiving cART may be at increased risk of worsening liver function. Adding treatment with an alpha interferon alone or in combination with ribavirin may increase the risk in this patient subset.

Reminder: Please read the "Other medicines" section of the Package Leaflet for the other medicines used in combination with Ribavira Teva before you begin combination treatment with this medicine.

# Pregnancy and breast-reeding

If you are pregnant you must not take this medicine. This medicine can be very damaging to your unborn baby (embego)

Both female and hale patients must take **special precautions** in their sexual activity if there is any possibility for pregnancy to occur:

or woman of childbearing age:

You must have a negative pregnancy test before treatment, each month during treatment, and for the 4 months after treatment is stopped. This should be discussed with your doctor.

### Men

To not have sex with a pregnant woman unless you **use a condom**. This will lessen the possibility for ribavirin to be left in the woman's body.

If your female partner is not pregnant now but is of childbearing age, she must be tested for pregnancy each month during treatment and for the 7 months after treatment has stopped. You or your female partner must use an effective contraceptive during the time you are taking this medicine and for 7 months after stopping treatment. This should be discussed with your doctor (see section "Do not take Ribavirin Teva").

If you are a woman who is **breast-feeding**, you must not take this medicine. Discontinue breast-feeding before starting to take this medicine.

# Driving and using machines

This medicine does not affect your ability to drive or use machines; however, other medicines used in combination with Ribavirin Teva may affect your ability to drive or use machines. Therefore, do not drive or use machines if you become tired, sleepy, or confused from this treatment.

### **Ribavirin Teva contains sodium**

This medicine contains less than 1 mmol sodium (23 mg) per hard capsule, that is to say essentially 'sodium-free'.

## 3. How to use Ribavirin Teva

#### General information about taking this medicine:

Always take this medicine exactly as your doctor has told you. Check with your doctor or than acist if you are not sure.

Do not take more than the recommended dosage and take the medicine for as long as precribed. Your doctor has determined the correct dose of this medicine based on how much you of the child you are caring for weighs.

#### Adults

The recommended dose and duration of Ribavirin Teva depends on how much the patient weighs and the medicines that are used in combination.

#### Use in children and adolescents

Dosing for children above 3 years of age and adolescents depends on how much the person weighs and the medicines that are used in combination. The recommended dose of Ribavirin Teva combined with interferon alfa-2b or peginterferon alfa-2b, is shown in the below table.

Ribavirin Teva dose based on body weight when used in combination with interferon alfa-2b or		
peginterferon alfa-2b in children above 3 years of age and adolescents		
If the child/adolescent weighs	Usual daily Ribavirin Teva	Number of 200 mg capsules
(kg)	dose	
47 - 49	600 mg	1 capsule in the morning and
	<b>N</b>	2 capsules in the evening
50 - 65	800 mg	2 capsules in the morning and
		2 capsules in the evening
> 65	See adult dose	

Take your prescribed dose by mouth with water and during your meal. Do not chew the hard capsules. For children or addresscents who cannot swallow a hard capsule, an oral solution of ribavirin is available.

nor: This medicine is only to be used in combination with other medicines for hepatitis C virus infection. For complete information be sure to read the "How to use" section of the Package Leaflet for the other medicines used in combination with Ribavirin Teva .

# If you take more Ribavirin Teva than you should

Tell your doctor or pharmacist as soon as possible.

### If you forget to take Ribavirin Teva

Take/administer the missed dose as soon as possible during the same day. If an entire day has gone by, check with your doctor. Do not take a double dose to make up for a forgotten dose

If you have any further questions on the use of this product, ask your doctor or pharmacist.

# 4. Possible side effects

Please read the "Possible side effects" section of the Package Leaflet for the other medicines used in combination with Ribavirin Teva.

Like all medicines, this medicine used in combination with other medicines can cause side effects, although not everybody gets them. Although not all of these unwanted effects may occur, they may need medical attention if they do occur.

**Contact your doctor immediately** if you notice any of the following side effects occurring during combination treatment with other medicines:

- chest pain or persistent cough; changes in the way your heart beats; fainting
- confusion, feeling depressed; suicidal thoughts or aggressive behaviour, attempt suicide, thoughts about threatening the life of others
- feelings of numbness or tingling
- trouble sleeping, thinking or concentrating
- severe stomach pain; black or tar-like stools; blood in stool or urine; lower or side pain
- painful or difficult urination
- severe bleeding from your nose
- fever or chills beginning after a few weeks of treatment
- problems with your eyesight or hearing
- severe skin rash or redness.

The following side effects have been reported with the combination of this medicine and an alpha interferon product **in adults**:

Very commonly reported side effects (may affect martian 1 in 10 people):

- decreases in the number of red blood cells (that may cause fatigue, shortness of breath, dizziness), decrease in neutrophils(that nake you more susceptible to different infections),
- difficulty concentrating, feeling anxious or nervous, mood swings, feeling depressed or irritable, tired feeling, trouble falling asleep or staying asleep,
- cough, dry mouth, pharyngitic (vol throat),
- diarrhoea, dizziness, fever, statike symptoms, headache, nausea, shaking chills, virus infection, vomiting, weakness,
- loss of appetite, loss of weight, stomach pain,
- dry skin, irritation, hair loss, itching, muscle pain, muscle aches, pain in joints and muscles, rash.

# Commonly reported side effects (may affect up to 1 in 10 people):

decrease in blood clotting cells called platelets that may result in easy bruising and spontaneous bleeding, decrease in certain white blood cells called lymphocytes that help fight infection, decrease in thyroid gland activity (which may make you feel tired, depressed, increase your sensitivity to obliand other symptoms), excess of sugar or uric acid (as in gout) in the blood, low calcium level in the blood, severe anaemia,

fungal or bacterial infections, crying, agitation, amnesia, memory impaired, nervousness, abnormal behaviour, aggressive behaviour, anger, feeling confused, lack of interest, mental disorder, mood changes, unusual dreams, wanting to harm yourself, feeling sleepy, trouble sleeping, lack of interest in sex or inability to perform, vertigo (spinning feeling),

blurred or abnormal vision, eye irritation or pain or infection, dry or teary eyes, changes in your hearing or voice, ringing in ears, ear infection, earache, cold sores (herpes simplex), change in taste, taste loss, bleeding gums or sores in mouth, burning sensation on tongue, sore tongue, inflamed gums, tooth problem, migraine, respiratory infections, sinusitis, nose bleed, nonproductive cough, rapid or difficult breathing, stuffy or runny nose, thirst, tooth disorder,

- cardiac murmur (abnormal heart beat sounds), chest pain or discomfort, feeling faint, feeling unwell, flushing, increased sweating, heat intolerance and excessive sweating, low or high blood pressure, palpitations (pounding heart beat), rapid heart rate,
