Summary of Risk Management Plan for KAFTRIO (Elexacaftor in Combination With Tezacaftor and Ivacaftor)

This is a summary of the risk management plan (RMP) for KAFTRIO when used in a combination regimen with ivacaftor 75mg or 150 mg tablets. The RMP details important risks of KAFTRIO, how these risks can be minimised, and how more information will be obtained about KAFTRIO’s risks and uncertainties (missing information) when used in combination with ivacaftor.

KAFTRIO’s summary of product characteristics (SmPC) and its package leaflet give essential information to healthcare professionals and patients on how KAFTRIO should be used.

This summary of the RMP for KAFTRIO should be read in the context of all this information including the assessment report of the evaluation and its plain-language summary, all which is part of the European Public Assessment Report (EPAR).

Important new safety concerns or changes to the current ones will be included in updates of KAFTRIO’s RMP.

I. The medicine and what it is used for

KAFTRIO in a combination regimen with ivacaftor (75 or 150 mg tablets) is authorised for the treatment of cystic fibrosis (CF) in patients aged 6 years and older who have at least one F508del mutation in the CF transmembrane conductance regulator (CFTR) gene (see SmPC for the full indication). It contains elexacaftor in combination with tezacaftor and ivacaftor as the active substances and it is given orally.

Further information about the evaluation of KAFTRIO’s benefits when used in combination with ivacaftor can be found in KAFTRIO’s EPAR, including its plain-language summary, available on the EMA website under the medicine’s webpage: https://www.ema.europa.eu/en/medicines/human/EPAR/kaftrio.

II. Risks associated with the medicine and activities to minimise or further characterise the risks

Important risks of KAFTRIO when used in combination with ivacaftor, together with measures to minimise such risks and the proposed studies for learning more about KAFTRIO’s risks, are outlined below.

Measures to minimise the risks identified for medicinal products can be

- Specific information, such as warnings, precautions, and advice on correct use, in the package leaflet and SmPC addressed to patients and healthcare professionals;
- Important advice on the medicine’s packaging;
- The authorised pack size — the amount of medicine in a pack is chosen so to ensure that the medicine is used correctly;
- The medicine’s legal status — the way a medicine is supplied to the patient (e.g. with or without prescription) can help to minimise its risks.

Together, these measures constitute routine risk minimisation measures.

If important information that may affect the safe use of KAFTRIO in combination with ivacaftor is not yet available, it is listed under ‘missing information’ below.
II.A List of important risks and missing information

Important risks of KAFTRIO in combination with ivacaftor are risks that need special risk management activities to further investigate or minimise the risk, so that the medicinal product can be safely taken. Important risks can be regarded as identified or potential. Identified risks are concerns for which there is sufficient proof of a link with the use of KAFTRIO. Potential risks are concerns for which an association with the use of this medicine is possible based on available data, but this association has not been established yet and needs further evaluation. Missing information refers to information on the safety of the medicinal product that is currently missing and needs to be collected (e.g., on the long-term use of the medicine).

II.B Summary of important risks

Susceptibility for influenza virus infections (Important identified risk)

Evidence for linking the risk to the medicine

In the 24-week, placebo-controlled Phase 3 study in CF subjects 12 years of age and older (Study 102), a higher incidence of influenza AEs was reported in the ELX/TEZ/IVA group compared to the placebo group. In the KAFTRIO (ELX/TEZ/IVA) group, all AEs of influenza were mild or moderate in severity and most were non-serious. All subjects continued KAFTRIO (ELX/TEZ/IVA) dosing or resumed treatment after an interruption. In the open-label extension Study 105, the rate of influenza AEs during extended KAFTRIO (ELX/TEZ/IVA) treatment was lower than the rate in the KAFTRIO (ELX/TEZ/IVA) group in Study 102, and similar to the rate in the placebo group in Study 102. The influenza data in subjects 6 through 11 years of age (Study 106) were consistent with those in subjects ≥12 years of age. Based on the overall safety experience with KAFTRIO (ELX/TEZ/IVA), an association between treatment and the susceptibility for influenza cannot be completely excluded.

Risk factors and risk groups

Patients who are hospitalised frequently or for long-term durations are at a greater risk for contracting influenza from other infected individuals. Risk factors for influenza-related complications include common CF comorbidities (e.g., chronic lung disease, asthma) and a compromised immune system.

Risk minimisation measures

SmPC Sections 4.8  
PL Section 4  
Prescription only

Additional pharmacovigilance activities

• Open-label extension study (Study 105)  
• Post-authorisation safety study  
• Open-label extension study (Study 107)  

See Section II.C of this summary for an overview of the post-authorisation development plan.
### Hepatotoxicity (Important identified risk)

**Evidence for linking the risk to the medicine**

In the 24-week, placebo-controlled, Phase 3 study in CF subjects 12 years of age and older (Study 102), the incidence of elevated transaminase events (AEs or ALT/AST laboratory elevations >3 × ULN) was higher in the group of subjects treated with KAFTRIO (ELX/TEZ/IVA) than in the group of subjects receiving placebo. LFT elevations were also seen in other clinical studies with KAFTRIO (ELX/TEZ/IVA), including the open-label extension study (Study 105). LFT elevations in subjects 6 through 11 years of age (Study 106) were consistent with those in subjects ≥12 years of age.

Elevated transaminases with KAFTRIO (ELX/TEZ/IVA) treatment were generally transient and resolved without long-term effects. Very high levels of transaminase elevations or transaminase elevations with concurrent total bilirubin elevation may be a sign of liver injury which could become permanent or be life-threatening. In addition, postmarketing reports of drug-induced liver injury have been received, including cases of liver injury characterized by concurrent elevations of transaminases and bilirubin, and one case of liver failure leading to transplantation in a patient with pre-existing cirrhosis and portal hypertension. An association with KAFTRIO (ELX/TEZ/IVA) treatment cannot be excluded in these cases. The overall safety experience with KAFTRIO (ELX/TEZ/IVA) suggests that an association between treatment and hepatotoxicity cannot be excluded.

**Risk factors and risk groups**

Generally known risk factors for increases in transaminases include concurrent acute and chronic infections or illnesses (e.g., pulmonary exacerbation, flu-like illness, viral hepatitis), comorbidities (e.g., CF liver disease), and use of concomitant drugs (e.g., acetaminophen, antibiotics) or substances (alcohol) known to be associated with liver enzyme elevations.

**Risk minimisation measures**

- SmPC Sections 4.4 and 4.8
- SmPC Section 4.4 where recommendations for LFT monitoring and treatment stopping rules are provided.
- PL Sections 2 and 4
- PL Sections 2 and 4 where liver damage and worsening of liver function in people with severe liver disease, expectations for LFT monitoring and detection of potential signs of liver problems are discussed.
- Prescription only

**Additional pharmacovigilance activities**

- Open-label extension study (Study 105)
- Post-authorisation safety study
- Open-label extension study (Study 107)

See Section II.C of this summary for an overview of the post-authorisation development plan.

### Cataract (Important potential risk)

**Evidence for linking the risk to the medicine**

Cataracts (lens opacities) considered related to IVA treatment were seen during studies in newborn rats but were not observed in older animals or in longer duration animal studies. Given developmental differences between rats and humans, it is unlikely that the cataract finding is relevant to humans 6 years of age and older.

Non-congenital cataracts without impact on vision have been reported in paediatric subjects treated with IVA-containing regimens during clinical studies and post-authorisation surveillance, but the relationship of these events to treatment is uncertain due to the presence of other possible causes.

**Risk factors and risk groups**

Risk factors for cataracts include aging, trauma, UV light and radiation exposure, diabetes mellitus, intraocular inflammation, and corticosteroid use.

**Risk minimisation measures**

- SmPC Sections 4.4 and 5.3
- SmPC Section 4.4 where recommendations for baseline and follow-up ophthalmological examinations in paediatric patients are provided.
- PL Section 2
- PL Section 2 where expectations for eye examinations are discussed.
- Prescription only

**Additional pharmacovigilance activities**

- Open-label extension study (Study 105)
- Open-label extension study (Study 107)

See Section II.C this summary for an overview of the post-authorisation development plan.

### Use in pregnant and lactating women (Missing information)

**Risk minimisation measures**

- SmPC Sections 4.6 and 5.3
- SmPC Section 4.6 where advice is given regarding use during pregnancy and breastfeeding.
- PL Section 2
- PL Section 2 where advice is given to speak with a healthcare professional before use during pregnancy and breastfeeding.
- Prescription only
II.C Post-authorisation development plan

II.C.1 Studies which are conditions of the marketing authorisation

There are no studies which are conditions of the marketing authorisation or specific obligation of KAFTRIO when used in a combination regimen with ivacaftor (150 mg tablets).

II.C.2 Other studies in post-authorisation development plan

Open-label extension study (Study 105)

Purpose of the study: To evaluate the long-term safety, tolerability, and efficacy and the pharmacodynamics of ELX/TEZ/IVA treatment for 96 weeks in subjects 12 years of age and older with CF, homozygous or heterozygous for the F508del-CFTR mutation

Post-authorisation safety study (PASS)

Purpose of the study: To evaluate the safety outcomes, CF disease progression, frequency and outcome of pregnancy, and drug utilisation patterns in CF patients taking ELX/TEZ/IVA in the real-world setting

Open-label extension study (Study 107)

Purpose of the study: To evaluate the long-term safety, tolerability, and efficacy and the pharmacodynamics of ELX/TEZ/IVA treatment for 96 weeks in subjects 6 years of age and older with CF, homozygous for F508del-CFTR mutation or heterozygous for F508del-CFTR and a minimal function mutation
